

Business model project & AI

We have developed a business model that projects our various activities over the year. This model is based on the activities carried out in the past years. The model is checked and updated every month according to the activity performed last month.

We would like to add AI in this model in order to refine projections by adding parameters like:

- Climatic conditions
- Staff trajectories (in and out) and available skills
- Major projects underway or to come as the construction of the Grand Paris or the renovation of the electric columns in the buildings (law called ELAN)
