

# Integrating Graphical Proofs in Coq

A description of the `coq-actema` system

---

**Pablo Donato** Benjamin Werner Kaustuv Chaudhuri

Partout team — LIX

CoqPL 2023

Boston

**Goal:** Make proof assistants *easier* to use

- **Intuitive** and **discoverable** for newcomers
- **Productive** and **beautiful** for experts

**Goal:** Make proof assistants *easier* to use

- **Intuitive** and **discoverable** for newcomers
- **Productive** and **beautiful** for experts

For now, focus on common logical heart:

*Intuitionistic First-Order* Logic (iFOL)

**Goal:** Make proof assistants *easier* to use

- **Intuitive** and **discoverable** for newcomers
- **Productive** and **beautiful** for experts

For now, focus on common logical heart:

*Intuitionistic First-Order* Logic (iFOL)

**Disclaimer:** WIP, still at an experimental stage...

# GRAPHICAL PROOFS

---

coq-actema

*“A demo is worth a thousand words..”*

# Paradigm

- Fully graphical: **no textual** proof language
- Both **spatial** and **temporal**:

proof = **gesture sequence**

- **Different modes** of reasoning with a **single “syntax”**:

Click  $\iff$  introduction/elimination

Drag-and-Drop  $\iff$  backward/forward

*Sound and **complete** for iFOL!*

## INTEGRATION WITH COQ

---

# Architecture

The diagram consists of three rectangular boxes arranged horizontally. The first box on the left is light green and contains the text 'Kernel'. The middle box is also light green and contains the text 'Plugin'. The third box on the right is white with a black border and contains the text 'Source'. There are no lines or arrows connecting these boxes.

# Protocol (interactive)

# Protocol (interactive)

# Protocol (interactive)

- **Click** actions: standard Coq tactics
- **Drag-and-Drop** actions:  $\sim 3000$  lines of Coq/Ltac
  - **Deep embedding** of goal  $\Gamma \vdash C$  in FOL
  - Subterm selection as **paths**, i.e. `list nat`
  - **Computational reflection** for *deep inference* semantics [Donato et al. (2022)]
    - Backward: new conclusion  $C'$
    - Forward: new hypothesis  $A$
  - Final tactic = apply **soundness** theorem
    - Backward:  $\Gamma \Rightarrow C' \Rightarrow C$
    - Forward:  $\Gamma \Rightarrow A$

## CONCLUSION

---

What are the most useful *usecases* of Actema?

- Proof **exploration**
- **Educational** setting

What were the *infrastructure* challenges/solutions?

- Interaction protocol that can handle **arbitrary goals and tactics** (still a WIP, because of FOL and notations)
- Generic protocol **independent of the specifics of Coq** (simpler with FOL)
- **Portable API with reusable boilerplate** for serialization on both sides (atdgen)
- **Linking external libraries** in Coq plugin, for serialization/HTTP (currently falls out of dune capabilities, need coq\_makefile)

## Related works (non-exhaustive)

- **Proof-by-Pointing** [Bertot et al. (1994)]
- **Subformula linking** [Chaudhuri (2013), Chaudhuri (2021)]
- **ProofWidgets** [Ayers et al. (2021)]
  - Framework for user-defined graphical notations
  - PA serves the GUI, instead of requesting from it
  - Relies on Lean's metaprogramming capabilities

## Future works

For more complex **theories**:

- Support arbitrary **Coq notations** (and more?)
- Selection-based **lemma search**
- Extend to **HOL**

For **proof evolution**:

- Translate graphical proof into *readable* and *reusable* **tactic invocations** (avoid paths)
- Replay/Edit graphical proof through **animations**

## Future works

For more complex **theories**:

- Support arbitrary **Coq notations** (and more?)
- Selection-based **lemma search**
- Extend to **HOL**

For **proof evolution**:

- Translate graphical proof into *readable* and *reusable* **tactic invocations** (avoid paths)
- Replay/Edit graphical proof through **animations**

*Thank you!*
