3. Proposed approach

4. Example

5. Challenges
Automatic verification of order of accuracy

Using symbolic execution and theorem proving techniques, it is possible to provide automatic formal verification of the accuracy of a numerical program.

- Extend the Toolkit for Accurate Scientific Software (TASS)
  - Symbolic execution tool
  - http://vsl.cis.udel.edu/tass
Error in numerical programs

- From numerical method (discretization error)
Error in numerical programs

- From numerical method (discretization error)
- From floating-point computations (round-off error)

"To put it baldly, most scientific results are corrupted and perhaps fatally so by undiscovered mistakes in the software used to calculate and present those results." (Les Hatton)

This project is focused on the discretization error.
Big-O

Definition

Let $I = (0, a), a > 0$. Suppose we have two functions $\phi : I \to \mathbb{R}$ and $\psi : I \to \mathbb{R}$. We write

$$\phi(h) = O(\psi(h)) \text{ as } h \to 0$$

if there exist positive real numbers $C$ and $\epsilon$ such that $|\phi(h)| \leq C|\psi(h)|$ whenever $0 < h < \epsilon$. 
Order of accuracy

Let $D \subseteq \mathbb{R}$, $I = (0, a)$, $a > 0$.

**Definition**

Let $n$ be a positive integer. Given a function $f : D \to \mathbb{R}$, consider a function $g : D \times I \to \mathbb{R}$. Fix $x \in D$. We say $g$ is an $n^{th}$ order accurate approximation to $f$ at $x$ if

$$f(x) - g(x, h) = O(h^n) \text{ as } h \to 0.$$
Order of accuracy

Note that a higher $n$ is better.

\[ y = n \]

\[ y = n^2 \]

\[ y = n^3 \]
Uniformly $n^{th}$ order accurate

**Definition**

Let $n$ be a positive integer. Given a function $f : D \rightarrow \mathbb{R}$, consider a function $g : D \times I \rightarrow \mathbb{R}$. Define $\phi : I \rightarrow \mathbb{R}$ by

$$
\phi(h) = \sup_{x \in D} |f(x) - g(x, h)|.
$$

We say that $g$ is a *uniformly $n^{th}$ order accurate approximation of $f$ on $D$* if

$$
\phi(h) = O(h^n) \text{ as } h \rightarrow 0.
$$
Grid approximations

\[
\begin{array}{ccc}
(i-1,j+1) & (i,j+1) & (i+1,j+1) \\
(i-1,j) & (i,j) & (i+1,j) \\
(i-1,j-1) & (i,j-1) & (i+1,j-1)
\end{array}
\]
Grid approximations

Definition

Let $n$ be a positive integer, $D \subseteq \mathbb{R}$, and $f$ a function from $D \rightarrow \mathbb{R}$. Let $I = (0, a)$, where $a$ is a positive real number and suppose $\Delta : I \rightarrow \varphi(D)$. Let $S = \bigcup_{h \in I} (\Delta(h) \times \{h\}) \subseteq D \times I$. Suppose $g : S \rightarrow \mathbb{R}$. Define $\phi : I \rightarrow \mathbb{R}$ by

$$\phi(h) = \sup_{x \in \Delta(h)} |f(x) - g(x, h)|.$$

We say $g$ is a $\Delta$-uniformly $n^{th}$ order accurate approximation of $f$ if

$$\phi(h) = O(h^n) \text{ as } h \rightarrow 0.$$
Example: derivative using central difference

Approximate a derivative by taking the slope through neighboring points.

\[ \rho'(x) \approx \frac{\rho(x + h) - \rho(x - h)}{2h} \]

---

<table>
<thead>
<tr>
<th>Definition</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>( D )</td>
<td>( \mathbb{R} )</td>
</tr>
<tr>
<td>( I )</td>
<td>((0, a))</td>
</tr>
<tr>
<td>( f(x) )</td>
<td>( \rho'(x) )</td>
</tr>
<tr>
<td>( g(x, h) )</td>

</tr>
<tr>
<td>( \Delta(h) )</td>
<td>( {ih</td>
</tr>
<tr>
<td>( S )</td>
<td>( \bigcup_{h \in I} (\Delta(h) \times {h}) )</td>
</tr>
<tr>
<td>( \phi )</td>
<td>( \sup_{x \in \Delta(h)} \left</td>
</tr>
</tbody>
</table>
Code

In this example, \( \Delta(h) = \{ ih | i \in \mathbb{Z}, 0 \leq i < n \} \)

```c
void differentiate(double h, int n, double[] y, double[] result) {
    int i;
    for(i = 1; i < n-1; i++) {
        result[i] = (y[i+1]-y[i-1])/(2*h);
    }
    result[0] = (y[1]-y[0])/h;
    result[m-1] = (y[n-1]-y[n-2])/h;
}
```

We want to show this is a \( \Delta \)-uniformly 2\(^{nd} \) order accurate approximation of \( \rho' \).
Current approaches

- Prove manually
  - Prove bounds on truncation error in the numerical method
  - Limitations
    - Manual proof could have an error
    - Program might not match the proved method
  - Assume correct translation to code

- Do convergence studies
  - Run for various values of $h$ and $x$
  - Limitations
    - Looking at a finite set of values for $h$ does not prove anything about the limit
    - Might not be valid for all $x$ in the input space
How the manual proof works

Show that

\[
\frac{\rho(x + h) - \rho(x - h)}{2h} - \rho'(x) = O(h^2).
\]
How the manual proof works

Show that

\[
\frac{\rho(x + h) - \rho(x - h)}{2h} - \rho'(x) = O(h^2).
\]

Use Taylor’s theorem with Lagrangian remainders:

\[
\rho(x + h) = \rho(x) + \rho'(x)h + \frac{1}{2}\rho''(x)h^2 + \frac{1}{6}\rho'''(\xi_1)h^3
\]

\[
\rho(x - h) = \rho(x) - \rho'(x)h + \frac{1}{2}\rho''(x)h^2 - \frac{1}{6}\rho'''(\xi_2)h^3.
\]
How the manual proof works

Suppose $\forall x. |\rho'''(x)| \leq M$. Then

$$\left| \frac{\rho(x+h) - \rho(x-h)}{2h} - \rho'(x) \right| = \frac{1}{12} \left| \rho'''(\xi_1) + \rho'''(\xi_2) \right| h^2 \leq \frac{1}{6} M h^2.$$

Therefore

$$\frac{\rho(x+h) - \rho(x-h)}{2h} - \rho'(x) = O(h^2).$$
Automatic verification of order of accuracy

Using symbolic execution and theorem proving techniques, it is possible to provide automatic formal verification of the accuracy of a numerical program.
Automatic verification of order of accuracy

Using symbolic execution and theorem proving techniques, it is possible to provide automatic formal verification of the accuracy of a numerical program.

- Develop a tool
  - Extend TASS, a powerful symbolic execution tool
  - Operate on the semantics of real numbers
- Prove relation between code and function
  - Bound the truncation error
  - Check for bugs
Automatic verification of order of accuracy

Using symbolic execution and theorem proving techniques, it is possible to provide automatic formal verification of the accuracy of a numerical program.

- Develop a tool
  - Extend TASS, a powerful symbolic execution tool
  - Operate on the semantics of real numbers
- Prove relation between code and function
  - Bound the truncation error
  - Check for bugs
- Automatic (almost)
  - Let the computer do similar work to manual proof
  - Need annotations
Abstract functions

//pragma TASS abstract continuous(3) bound(3) double rho(double x);

Derivatives

\( \frac{\partial \rho}{\partial x} \)

Quantifiers

\( \forall \{ \text{int } j \} \ a[j] == j*j; \)
\( \forall \{ \text{int } j \ | \ 0 <= j && j < n \} \ a[j] == j*j; \)
\( \forall \{ j=0..n-1 \} \ a[j] == j*j; \)

Assumptions

//pragma TASS assume x==0.0;

Assertions

//pragma TASS assert x==0.0;

Big-O

\( O(h) \)

Uniform

//pragma TASS assert uniform \{ j=1..n-2 \} \ result[j]-\frac{\partial \rho}{\partial x}(j*h) == O(h^2); \)
Annotated code

```c
void differentiate(double h, int m, double[] y, double[] result) {
    #pragma TASS abstract continuous(3) bound(3) double rho(double x);
    #pragma TASS assume forall {j=0..m-1} y[j]==rho(j*h);
    int i;
    for(i = 1; i < m-1; i++) {
        result[i] = (y[i+1]-y[i-1])/(2*h);
    }
    result[0] = (y[1]-y[0])/h;
    result[m-1] = (y[m-1]-y[n-2])/h;
    #pragma TASS assert uniform {j=1..m-2} \n        result[j]-\D[rho,{x,1}](j*h) == \O(h^2);
}
```
Symbolic execution

```c
void differentiate(double h, int m, double[] y, double[] result) {
