Problem 1.

Distance CSPs

Input: A finite set of variables x_1, \ldots, x_n , a finite set of constraints of the form $x_i - x_j = 1$ or of the form $|x_i - x_j| = 1$.

Question: Is there a mapping $s : \{x_1, \ldots, x_n\} \to \mathbb{Z}$ that satisfies all constraints?

Problem 1.

Input: A finite set of variables x_1, \ldots, x_n , a finite set of constraints of the form $x_i - x_j = 1$ or of the form $|x_i - x_j| = 1$. Question: Is there a mapping $s : \{x_1, \ldots, x_n\} \to \mathbb{Z}$ that satisfies all constraints?

Solvable in polynomial time.

Constraint Satisfaction Problems: Formal Definition

Let τ be a finite set of relation symbols. Let $\Gamma = (D; R_1, R_2, ...)$ be a τ -structure (also called template).

 $\mathsf{CSP}(\Gamma)$

Input: A primitive positive τ -sentence Φ , i.e., a first-order sentence of the form

 $\exists x_1,\ldots,x_n.\psi_1\wedge\cdots\wedge\psi_l$

where ψ_i are atomic, i.e. of the form $R(x_{i_1}, \ldots, x_{i_k})$ for $R \in \tau$. Question: Is Φ true in Γ ?

This paper: study complexity of Distance CSPs.

Definition

A Distance CSP is a problem of the form $CSP(\Gamma)$ where Γ has a first-order definition in $(\mathbb{Z}; \{(x, y) \mid x - y = 1\})$.

Note:

- $(\mathbb{Z}; x y = 1, |x y| = 1)$ and $(\mathbb{Z}; x y = 1, |x y| \in \{1, 3\})$ do have a first-order definition in $(\mathbb{Z}; \{(x, y) \mid x - y = 1\})$.
- Allow any number of relations of any arity!

- Γ has a modular median polymorphism.
 In this case, CSP(Γ) can be solved in polynomial time.

Our main algorithmic tool: constraint propagation and *k*-consistency.

(日)

Our main algorithmic tool: constraint propagation and *k*-consistency.

Idea: perform *k*-local inferences until a fixed point is reached, which is then called *k*-consistent.

Example for k = 3: Look at the constraints on three variables and add the binary constraints they imply.

Our main algorithmic tool: constraint propagation and *k*-consistency.

When is constraint propagation complete for $CSP(\Gamma)$?

The *d*-modular median is the operation $m_d : \mathbb{Z}^3 \to \mathbb{Z}$ defined as follows:

- If *x*, *y*, *z* are congruent modulo *d*, then *m_d*(*x*, *y*, *z*) equals the median of *x*, *y*, *z*.
- If precisely two arguments from x, y, z are congruent modulo d, then m_d(x, y, z) equals the first of those arguments in the ordered sequence (x, y, z).

• Otherwise,
$$m_d(x, y, z) = x$$
.

The 1-modular median is the usual median operation. The modular median is a majority operation.

Theorem 4.

Let Γ be a first-order expansion of $(\mathbb{Z}; \{(x, y) \mid x - y = 1\})$. Then

- Γ is preserved by a modular median and $CSP(\Gamma)$ is in P, or
- CSP(Γ) is NP-hard.

An endomorphism of Γ is a homomorphism from Γ to itself. **Example:** $x \mapsto (x \mod 2)$ is an endomorphism of

 $(\mathbb{Z}; \{(x, y) \mid |x - y| = 1\})$

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□▶

An endomorphism of Γ is a homomorphism from Γ to itself. **Example:** $x \mapsto (x \mod 2)$ is an endomorphism of

```
(\mathbb{Z}; \{(x, y) \mid |x - y| = 1\})
```

Theorem 5.

Let Γ be a finite-degree structure with a first-order definition in $(\mathbb{Z}; \{(x, y) \mid x - y = 1\})$. Then

1 The automorphism group of Γ equals either the automorphism group of $(\mathbb{Z}; \{(x, y) \mid x - y = 1\})$, or that of $(\mathbb{Z}; \{(x, y) \mid |x - y| = 1\})$.

Theorem 6.

Every finite degree relational structure Γ with a first-order definition in $(\mathbb{Z}; \{(x, y) \mid x - y = 1\})$ is either homomorphically equivalent to a finite structure, or to a connected finite-degree structure Δ with a first-order definition in $(\mathbb{Z}; \{(x, y) \mid x - y = 1\})$ such that

CSP (Δ) is NP-hard, or

• the relation $\{(x, y) | x - y = 1\}$ is primitive positive definable.

The CSP of the expansion of Γ by a primitive positive definable relation reduces to CSP(Γ) in polynomial time.

Hence, may assume in the following that Γ contains the relation $\{(x, y) \mid x - y = 1\}$.

Concluding Remarks

Distance CSPs confirm the importance of constraint propagation:

Unless a distance CSP is NP-hard or equivalent to a finite-domain CSP, it can be solved in polynomial time by constraint propagation with binary constraints.

Concluding Remarks

Distance CSPs confirm the importance of constraint propagation:

Unless a distance CSP is NP-hard or equivalent to a finite-domain CSP, it can be solved in polynomial time by constraint propagation with binary constraints.

On the way, obtain interesting results about endomorphism monoids and primitive positive definability in structures over \mathbb{Z} .

Important open problems:

- Classify the complexity of finite-domain CSPs with a transitive template.
- If a finite-domain CSP or a distance CSP has a majority polymorphism, can it be solved in linear time? (the algorithm presented here is cubic)
