

# Quantitative Information Flow

## Lecture 7

## The basic model:

Systems = Information-Theoretic channels

Probabilistic systems are **noisy** channels:

an output can correspond to different inputs, and

an input can generate different outputs, according to a prob. distribution

$p(o_j|s_i)$ : the conditional probability to observe  $o_j$  given the secret  $s_i$

	$O_1$	...	$O_n$
$S_1$	$p(O_1 S_1)$	...	$p(O_n S_1)$
$\vdots$	$\vdots$		
$S_m$	$p(O_1 S_m)$		$p(O_n S_m)$

$$p(o|s) = \frac{p(o \text{ and } s)}{p(s)}$$

A channel is characterized by its matrix: the array of conditional probabilities

In an information-theoretic channel these conditional probabilities are independent from the input distribution; they depend only on the way the channel operates on the inputs.

In our case, the conditional probabilities depend only on the way the system works. We assume that this is known to the adversary.

# Password-checker 1

```
out := OK
for i = 1, ..., N do
  if  $x_i \neq K_i$  then
    out := FAIL

  end if
end for
```

Let us construct the channel matrix

Note: The string  $x_1x_2x_3$  typed by the user is a parameter, and  $K_1K_2K_3$  is the channel input

The standard view is that the input represents the secret. Hence we should take  $K_1K_2K_3$  as the channel input

# Password-checker 1

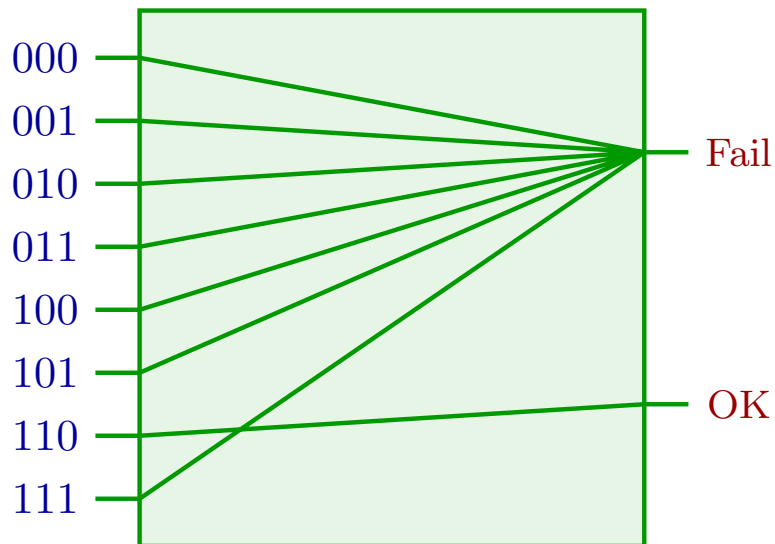

```
out := OK
for i = 1, ..., N do
  if  $x_i \neq K_i$  then
    out := FAIL
  end if
end for
```

Assume the user string is  $x_1x_2x_3 = 110$

Let us construct the channel matrix

Input:  $K_1K_2K_3 \in \{000, 001, \dots, 111\}$

Output:  $out \in \{OK, FAIL\}$

	Fail	OK
000	1	0
001	1	0
010	1	0
011	1	0
100	1	0
101	1	0
110	0	1
111	1	0

Different values of  $x_1x_2x_3$  give different channel matrices, but they all have this kind of shape (seven inputs map to Fail, one maps to OK)

# Password-checker 2

```
out := OK
for i = 1, ..., N do
  if  $x_i \neq K_i$  then
    { out := FAIL
      exit()
    }
  end if
end for
```

Assume the user string is  $x_1x_2x_3 = 110$

Assume the adversary can measure the execution time

Let us construct the channel matrix

Input:  $K_1K_2K_3 \in \{000, 001, \dots, 111\}$

Output:  $out \in \{OK, (FAIL, 1), (FAIL, 2), (FAIL, 3)\}$

	(Fail, 1)	(Fail, 2)	(Fail, 3)	OK
000	1	0	0	0
001	1	0	0	0
010	1	0	0	0
011	1	0	0	0
100	0	1	0	0
101	0	1	0	0
110	0	0	0	1
111	0	0	1	0

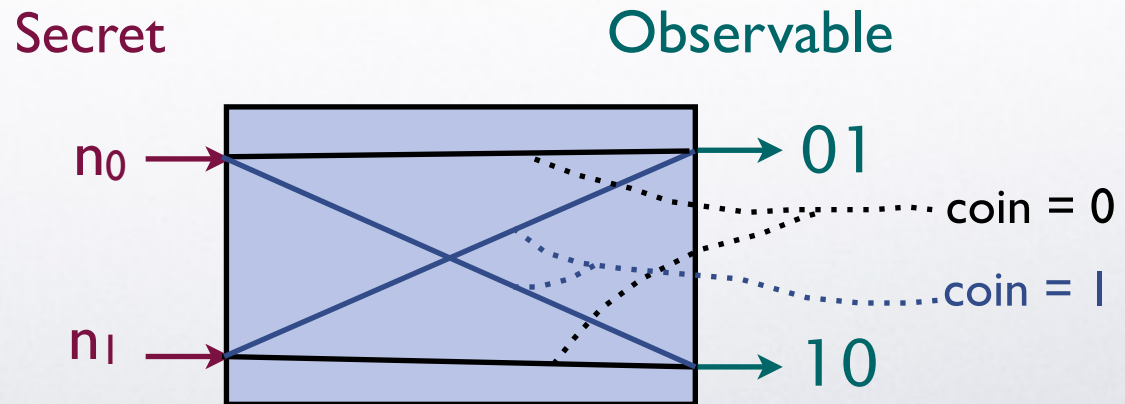

Example: DC nets. Ring of 2 nodes, and assume  $b = 1$

Let us construct the channel matrix

Input:  $n_0, n_1$

Output: the declarations of  $n_1$  and  $n_0$ :  $d_1 d_0 \in \{01, 10\}$

Example: DC nets. Ring of 2 nodes, and assume  $b = 1$

Let us construct the channel matrix

Input:  $n_0, n_1$

Output: the declarations of  $n_1$  and  $n_0$ :  $d_1 d_0 \in \{01, 10\}$

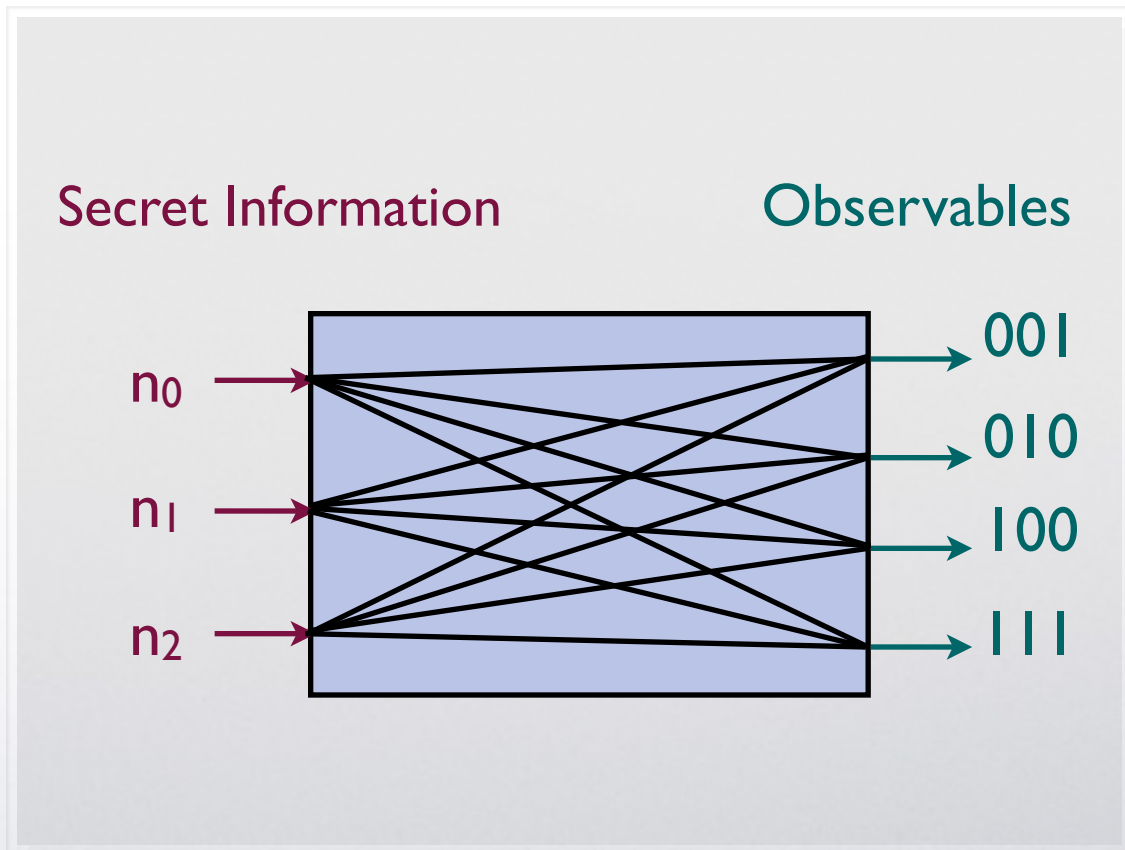

Fair coin:  $p(0) = p(1) = \frac{1}{2}$

Biased coin:  $p(0) = \frac{2}{3}$   $p(1) = \frac{1}{3}$

	01	10
$n_0$	$\frac{1}{2}$	$\frac{1}{2}$
$n_1$	$\frac{1}{2}$	$\frac{1}{2}$

	01	10
$n_0$	$\frac{2}{3}$	$\frac{1}{3}$
$n_1$	$\frac{1}{3}$	$\frac{2}{3}$

## Example: DC nets (ring of 3 nodes, $b=1$ )

## Example: DC nets (ring of 3 nodes, $b=1$ )

	001	010	100	111
$n_0$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$
$n_1$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$
$n_2$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$

fair coins:  $\Pr(0) = \Pr(1) = \frac{1}{2}$

strong anonymity

	001	010	100	111
$n_0$	$\frac{1}{3}$	$\frac{2}{9}$	$\frac{2}{9}$	$\frac{2}{9}$
$n_1$	$\frac{2}{9}$	$\frac{1}{3}$	$\frac{2}{9}$	$\frac{2}{9}$
$n_2$	$\frac{2}{9}$	$\frac{2}{9}$	$\frac{1}{3}$	$\frac{2}{9}$

biased coins:  $\Pr(0) = \frac{2}{3}$ ,  $\Pr(1) = \frac{1}{3}$

The source is more likely to declare 1 than 0

# Quantitative Information Flow

- Intuitively, the **leakage** is the (probabilistic) information that the adversary **gains** about the **secret** through the **observables**
- Each observable **changes** the **prior** probability distribution on the secret values into a **posterior** probability distribution according to the **Bayes** theorem
- In the average, the posterior probability distribution gives a **better hint** about the actual secret value

Observables: prior  $\Rightarrow$  posterior

Observables: prior  $\Rightarrow$  posterior

# Exercise 1

- Assuming that the possible passwords have uniform prior distribution, compute the matrix of the joint probabilities, and the posterior probabilities, for the two password-checker programs

# Exercise 2

- **DC net with 2 nodes:** Assuming that  $n_0$  and  $n_1$  have uniform prior distribution, compute the matrix of the joint probabilities, and the posterior probabilities, in the two cases of fair coins, and of biased coins
- Same exercise, but now assume that the prior distribution is  $2/3$  for  $n_0$  and  $1/3$  for  $n_1$

# Towards a quantitative notion of leakage

A general principle:

Leakage = difference between  
the a priori vulnerability  
and  
the a posteriori vulnerability

- vulnerability = vulnerability of the secret,
- a priori / a posteriori = before / after the observation

Intuitively the vulnerability depends on the distribution: the more uncertainty there is about the exact value of the secret, the less vulnerable the secret is.

Note that the observation updates the input probability:

$$p(s|o) = p(s) \frac{p(o|s)}{p(o)} \quad \text{Bayes theorem}$$

# Information theory: useful concepts

- **Entropy  $H(X)$  of a random variable  $X$** 
  - A measure of the degree of uncertainty of the events
  - It can be used to measure the vulnerability of the secret, i.e. how “easily” the adversary can discover the secret
- **Mutual information  $I(S;O)$** 
  - Degree of correlation between the input  $S$  and the output  $O$
  - formally defined as difference between:
    - $H(S)$ , the entropy of  $S$  *before* knowing, and
    - $H(S|O)$ , the entropy of  $S$  *after* knowing  $O$
  - It can be used to measure the leakage:  
$$\text{Leakage} = I(S;O) = H(S) - H(S|O)$$
  - $H(S)$  depends only on the prior;  $H(S|O)$  can be computed using the prior and the channel matrix

# Notions of Entropy

- In Information Theory, there are several notions of entropy:
  - Shannon's entropy (which is the most famous),
  - the Rényi's entropies,
  - guessing entropy
  - ...
- Which one should we choose ?
