Research Activities

- *Reformulations in mathematical programming*. Mathematical Programming (MP) is a formal language for describing optimization problems. A MP consists of parameters (encoding the problem instance), decision variables (encoding the solution), objective functions and constraints. Limited to functional forms which can be represented by Directed Acyclic Graphs (DAGs) the leaves of which are parameters and variables, the other nodes being the operators, a *reformulation* is a computable transformation of a MP P into another MP Q which shares some mathematical property \mathcal{P} with P (e.g. $\mathcal{P} \equiv$ “all optima of Q are optima of P ”).
