Coproducts, pullbacks, monoids

1 Coproducts

Notions in category theory can always be "dualized" in the following way.

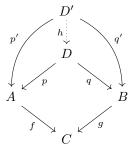

1. Given a category \mathcal{C} define the category \mathcal{C}^{op} obtained by reversing the morphisms.

A <u>cosomething</u> in a category C is a something in C^{op} .

- 2. Show that **Set** is a cocartesian category, i.e. has coproducts and an initial object (an initial object is a coterminal object).
- 3. Show that the usual categories are cocartesian: Set, Top, Rel, Vect, Cat.

2 Pullbacks

Given two morphisms $f:A\to C$ and $g:B\to C$ with the same target, a pullback is given by an object D (sometimes abusively noted $A\times_C B$) together with two morphisms $p:D\to A$ and $q:D\to B$ such that $f\circ p=g\circ q$, and for every pair of morphisms $p':D'\to A$ and $q':D'\to B$ (with the same source) such that $f\circ p'=g\circ q'$, there exists a unique morphism $h:D'\to D$ such that $p\circ h=p'$ and $q\circ h=q'$.

- 1. What is a pullback in the case where C is the terminal object?
- 2. What is a pullback in **Set**?

A pushout in a category C is a pullback in C^{op} .

- 3. What is a pushout in **Set**? In **Top**?
- 4. Show that the pushout of an isomorphism is an isomorphism.

3 Monomorphisms

A monomorphism is a morphism $f: A \to B$ such that for every morphisms $g_1, g_2: A' \to A$, we have that $f \circ g_1 = f \circ g_2$ implies $g_1 = g_2$:

$$A' \xrightarrow{g_1} A \xrightarrow{f} B$$

- 1. What is a monomorphism in **Set**?
- 2. Show that the pullback of a monomorphism along any morphism is a monomorphism.
- 3. Show that, in **Set**, the pushout of a monomorphism along any morphism is a monomorphism. Does this seem to be true in any category?
- 4. Define the dual notion of *epimorphism*. What is an epimorphism in **Set**?
- 5. In the category of posets, construct a morphism which is both a monomorphism and an epimorphism, but not an isomorphism.

4 (Co)monoids in cartesian categories

- 1. Given a cartesian category \mathcal{C} , show that the cartesian product induces a functor $\mathcal{C} \times \mathcal{C} \to \mathcal{C}$.
- 2. Generalize the definition of *monoid* to any cartesian category (a monoid in **Set** should be a monoid in the usual sense). When is a monoid commutative?
- 3. Generalize the notion of morphism of monoid.
- 4. A comonoid in C is a monoid in C^{op} . Make explicit the notion of comonoid.
- 5. What part of the cartesian structure on C did we really need in order to define the notion of monoid?
- 6. Show that in a cartesian category every object is a comonoid (with respect to product).
- 7. Given a category C, show that the category of commutative comonoids and morphisms of comonoids in C is cartesian.
