Graphs

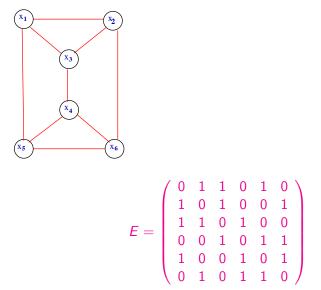

Definition

A graph is given by a set $X = \{x_1, x_2, ..., x_n\}$ of vertices and a set E of edges, consisting of pairs of vertices.

Definition

The adjacency matrix of a graph denoted also by E is given by: $e_{i,j}$ is equal to the number of edges between the vertices x_i and x_j .

An example

Graphs, conventions

- There are no loops, multiple edges may be allowed
- All graphs are supposed connected
- The degree of a vertex is the number of edges incident to it

$$d_i = \sum_{j=1}^n e_{i,j}$$

• The number of edges of the graph is denoted *m*.

• A configuration is an assignment of integers (positive or negative) to vertices.

Two different writings will be used:

 $u = (u_1, u_2, \cdots, u_n)$ or $u = \sum_{i=1}^n u_i x_i$

• A configuration is an assignment of integers (positive or negative) to vertices.

Two different writings will be used:

$$u = (u_1, u_2, \cdots, u_n)$$
 or $u = \sum_{i=1}^n u_i x_i$

• A configuration u is **positive** if $u_i \ge 0$ for all i = 1, n.

• A configuration is an assignment of integers (positive or negative) to vertices.

Two different writings will be used:

$$u = (u_1, u_2, \cdots, u_n)$$
 or $u = \sum_{i=1}^n u_i x_i$

- A configuration u is **positive** if $u_i \ge 0$ for all i = 1, n.
- *u* is a **sandpile** configuration if $u_i \ge 0$ for all i = 1, n 1, and u_n may be positive or not.

• A configuration is an assignment of integers (positive or negative) to vertices.

Two different writings will be used:

$$u = (u_1, u_2, \cdots, u_n)$$
 or $u = \sum_{i=1}^n u_i x_i$

- A configuration u is **positive** if $u_i \ge 0$ for all i = 1, n.
- *u* is a **sandpile** configuration if $u_i \ge 0$ for all i = 1, n 1, and u_n may be positive or not.
- The degree of a configuration *u* is given by :

$$deg(u) = \sum_{i=1}^{n} u_i$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• The **toppling** of vertex *x_i* consists in giving *d_i* tokens, one to each of its neighbors.

- The **toppling** of vertex *x_i* consists in giving *d_i* tokens, one to each of its neighbors.
- Not necessary to have enough tokens, the number of tokens may become (or stay) negative.

- The **toppling** of vertex *x_i* consists in giving *d_i* tokens, one to each of its neighbors.
- Not necessary to have enough tokens, the number of tokens may become (or stay) negative.
- In a toppling *u* becomes *v* such that:

$$v_i = u_i - d_i$$
 and for $j \neq i$ $v_j = u_j + e_{i,j}$

- The **toppling** of vertex *x_i* consists in giving *d_i* tokens, one to each of its neighbors.
- Not necessary to have enough tokens, the number of tokens may become (or stay) negative.
- In a toppling *u* becomes *v* such that:

$$v_i = u_i - d_i$$
 and for $j \neq i$ $v_j = u_j + e_{i,j}$

$$v = u + (e_{i,1}, e_{i,2}, \dots, e_{i,i-1}, -d_i, e_{i,i+1}, \dots e_{i,n})$$

$$\Delta^{(i)} = d_i x_i - \sum_{i=1}^n e_{i,j} x_j$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

$$\Delta^{(i)} = d_i x_i - \sum_{i=1}^n e_{i,j} x_j$$

• Hence after a toppling of vertex x_i we have

 $v = u - \Delta^{(i)}$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

$$\Delta^{(i)} = d_i x_i - \sum_{i=1}^n e_{i,j} x_j$$

• Hence after a toppling of vertex x_i we have

$$v = u - \Delta^{(i)}$$

• Notice that:

$$\sum_{i=1}^{n} \Delta^{(i)} = 0$$

$$\Delta^{(i)} = d_i x_i - \sum_{i=1}^n e_{i,j} x_j$$

Hence after a toppling of vertex x_i we have

 $v = u - \Delta^{(i)}$

• Notice that:

$$\sum_{i=1}^n \Delta^{(i)} = 0$$

Corresponds to the rows of the Laplacian matrix

 $\Delta = D - E$

where *D* is the diagonal matrix such that $D_{i,i} = d_i$ and *E* is the adjacency matrix.

Laplacian equivalence

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

• If u - v is a linear combination of the Laplacian configurations $\Delta^{(i)}$ we will write

 $u \sim_{L_G} v$

Main question

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• Given a configuration *u* with negative values does there exist a sequence of topplings leading to a positive one?

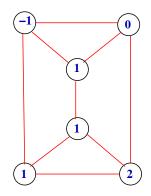

Main question

- Given a configuration *u* with negative values does there exist a sequence of topplings leading to a positive one?
- Algebraic translation: Does the exist a linear combination v of the $\Delta^{(i)}$ such that u + v is positive.

Main question

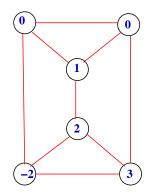

- Given a configuration *u* with negative values does there exist a sequence of topplings leading to a positive one?
- Algebraic translation: Does the exist a linear combination v of the $\Delta^{(i)}$ such that u + v is positive.
- A configuration *u* for which such a *v* exists will be called here **effective**

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへで

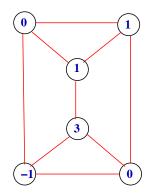

$u = -x_1 + x_3 + x_4 + x_5 + 2x_6$

An Example

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

An acyclic orientation and the configuration associated to it

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Proposition

For any acyclic orientation \overrightarrow{G} of G the configuration $u_{\overrightarrow{G}}$ associated to it is non effective.

Proof.

Proof.

- Consider a configuration v such that $v\sim_{L_G}u_{\overrightarrow{G}}$ then

$$v = u_{\overrightarrow{G}} + \sum_{i=1}^{n} a_i \Delta^{(i)}$$

Proof.

• Consider a configuration v such that $v \sim_{L_G} u_{\overrightarrow{G}}$ then

$$v = u_{\overrightarrow{G}} + \sum_{i=1}^{n} a_i \Delta^{(i)}$$

 The a_i's may be supposed negative since the sum of all the the Δ⁽ⁱ⁾ is equal to 0.

▲□ > ▲圖 > ▲≣ > ▲≣ > ● ④ < ↔

Proof.

• Consider a configuration v such that $v \sim_{L_G} u \rightarrow then$

$$v = u_{\overrightarrow{G}} + \sum_{i=1}^{n} a_i \Delta^{(i)}$$

- The a_i's may be supposed negative since the sum of all the the Δ⁽ⁱ⁾ is equal to 0.
- Let j be such that −a_j is maximal among the −a_i, then
 v_j ≥ 0 implies that there exists an edge x_k, x_j oriented from x_k to x_j such that a_k = a_j;

Proof.

• Consider a configuration v such that $v \sim_{L_G} u_{\overrightarrow{G}}$ then

$$v = u_{\overrightarrow{G}} + \sum_{i=1}^{n} a_i \Delta^{(i)}$$

- The a_i's may be supposed negative since the sum of all the the Δ⁽ⁱ⁾ is equal to 0.
- Let j be such that −a_j is maximal among the −a_i, then
 v_j ≥ 0 implies that there exists an edge x_k, x_j oriented from x_k to x_j such that a_k = a_j;
- Repeating this remark implies that G has a circuit, contradicting acyclicity.

Parking configurations

• Definition

A parking configuration is a sandpile configuration u such that for any subset Y of $\{x_1, x_2, \ldots, x_{n-1}\}$ there exists a vertex x_i in Ysuch that u_i is less than the number of edges with have as end points x_i and an x_i not in Y. More precisely:

$$\exists x_i \in Y, s.t: \quad u_i < \sum_{x_j \notin Y} e_{i,j}$$

Parking configurations

• Definition

A parking configuration is a sandpile configuration u such that for any subset Y of $\{x_1, x_2, \ldots, x_{n-1}\}$ there exists a vertex x_i in Ysuch that u_i is less than the number of edges with have as end points x_i and an x_i not in Y. More precisely:

$$\exists x_i \in Y, s.t: \quad u_i < \sum_{x_j \notin Y} e_{i,j}$$

Remark

In the case of the complete graph:

$$\sum_{\mathsf{x}_j \notin Y} e_{i,j} = n - |Y|$$

so that the condition correspond to the usual parking functions.

Parking and recurrent configurations

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

• Proposition

A configuration u is a parking configuration if and only if \overline{u} given by: $\overline{u}_i = d_i - 1 - u_i$ is a recurrent configuration.

Parking and recurrent configurations

• Proposition

A configuration u is a parking configuration if and only if \overline{u} given by: $\overline{u}_i = d_i - 1 - u_i$ is a recurrent configuration.

• Corollary

For each configuration u there is a (unique) parking configuration v such that $u \sim_{L_G} v$

Parking configurations and acyclic orientations

Proposition

For any parking configuration u there exists an acyclic orientation \overrightarrow{G} such that for any vertex x_i , $i \neq n$, $u_i < d_i^-$.

Parking configurations and acyclic orientations

Proposition

For any parking configuration u there exists an acyclic orientation \overrightarrow{G} such that for any vertex x_i , $i \neq n$, $u_i < d_i^-$.

Proof.

$$Y = \{x_1, x_2, \ldots, x_{n-1}\}$$

While $Y \neq \emptyset$ do:

- Find $x_k \in Y$ such that $u_k < \sum_{x_i \notin Y} e_{k,j}$
- Orient the edges joining x_j ∉ Y to x_k from x_j t(tail) to x_k (head)

• Remove x_k from Y.

Deciding effectiveness

Corollary

u is effective if and only if the parking configuration *w* such that $w \sim_{L_G} u$ satisfies $w_n \ge 0$

Main Theorem

• Theorem

For any configuration u one of the following assertions holds: (1) u is effective (11) There exists an acyclic orientation \overrightarrow{G} of G such that $u_{\overrightarrow{G}} - u$ is effective.

Main Theorem

• Theorem

For any configuration u one of the following assertions holds: (1) u is effective (11) There exists an acyclic orientation \overrightarrow{G} of G such that $u_{\overrightarrow{G}} - u$ is effective.

• Remark

Assertions (I) and (II) cannot hold simultaneously since:

 $u + (u_{\overrightarrow{G}} - u) = u_{\overrightarrow{G}}$

The configuration u = (0, 2, 2, 2) on K_4

The rank is not greater than 3.

Subtract a positive configuration of degree 4 and prove non effectiveness

Subtraction of (0,3,1,0) gives (0,-1,1,2) which is associated to an acyclic orientation

Proposition If deg(u) > 2m - 2n then

 $\rho(u) = \deg(u) - m + n - 1$

Proposition If deg(u) > 2m - 2n then

 $\rho(u) = \deg(u) - m + n - 1$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Proof.

Proposition If deg(u) > 2m - 2n then

$$ho(u) = deg(u) - m + n - 1$$

Proof. Let r = deg(u) - m + n - 1. If deg(f) = r then deg(u - f) = m - n + 1 hence it is effective and $\rho(u) \ge r$

Proposition If deg(u) > 2m - 2n then

$$ho(u) = deg(u) - m + n - 1$$

Proof. Let r = deg(u) - m + n - 1. If deg(f) = r then deg(u - f) = m - n + 1 hence it is effective and $\rho(u) \ge r$ Let \overrightarrow{G} be an acyclic orientation of G, $deg(u - u_{\overrightarrow{G}}) > 2(m - n) - m + n$ hence $u - u_{\overrightarrow{G}}$ is effective

Proposition If deg(u) > 2m - 2n then

$$\rho(u) = deg(u) - m + n - 1$$

Proof. Let r = deg(u) - m + n - 1. If deg(f) = r then deg(u - f) = m - n + 1 hence it is effective and $\rho(u) \ge r$ Let \overrightarrow{G} be an acyclic orientation of G, $deg(u - u_{\overrightarrow{G}}) > 2(m - n) - m + n$ hence $u - u_{\overrightarrow{G}}$ is effective Let f be such that $f \sim_{L_G} u - u_{\overrightarrow{G}}$ then $u - f \sim_{L_G} u_{\overrightarrow{G}}$ is not effective. Since deg(f) = deg(u) - m + n = r + 1, we have $\rho(u) < r + 1$.

Theorem

Let K be the configuration such that $K_i = d_i - 2$, so that deg(K) = 2(m - n). Any configuration u satisfies:

$$\rho(u) = deg(u) - m + n + \rho(K - u)$$

Let f be such that u - f non effective and $deg(f) = \rho(u) + 1$

Let f be such that u - f non effective and $deg(f) = \rho(u) + 1$ There exists \overrightarrow{G} such that $u_{\overrightarrow{G}} - (u - f)$ is effective hence:

$$u_{\overrightarrow{G}} - (u - f) \sim_{L_G} g$$

Let f be such that u - f non effective and $deg(f) = \rho(u) + 1$ There exists \overrightarrow{G} such that $u_{\overrightarrow{G}} - (u - f)$ is effective hence:

$$u_{\overrightarrow{G}} - (u - f) \sim_{L_G} g$$

Consider the reverse orientation \overleftarrow{G} and add $u_{\overleftarrow{G}}$ to both sides this gives:

 $K - u + f \sim_{L_G} g + u_{\overleftarrow{G}}$

Let f be such that u - f non effective and $deg(f) = \rho(u) + 1$ There exists \overrightarrow{G} such that $u_{\overrightarrow{G}} - (u - f)$ is effective hence:

$$u_{\overrightarrow{G}} - (u - f) \sim_{L_G} g$$

Consider the reverse orientation \overleftarrow{G} and add $u_{\overleftarrow{G}}$ to both sides this gives:

 $K - u + f \sim_{L_G} g + u_{\overleftarrow{G}}$

Showing that K - u - g is not effective hence

 $\rho(K-u) < \deg(g) = \deg(u_{\overrightarrow{G}} - (u-f)) = m - n - \deg(u) + \rho(u) + 1$

 $\rho(K - u) < m - n - deg(u) + \rho(u) + 1$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

$$\rho(K - u) < m - n - \deg(u) + \rho(u) + 1$$

Applying the same inequality to K - u gives:

 $\rho(u) < m - n - \deg(K - u) + \rho(K - u) + 1$

$$\rho(K - u) < m - n - \deg(u) + \rho(u) + 1$$

Applying the same inequality to K - u gives:

 $\rho(u) < m - n - \deg(K - u) + \rho(K - u) + 1$

But deg(K - u) = 2m - 2n - deg(u) gives:

 $\rho(u) + m - n - \deg(u) - 1 < \rho(K - u)$

$$\rho(K - u) < m - n - \deg(u) + \rho(u) + 1$$

Applying the same inequality to K - u gives:

 $\rho(u) < m - n - \deg(K - u) + \rho(K - u) + 1$

But deg(K - u) = 2m - 2n - deg(u) gives: $\rho(u) + m - n - deg(u) - 1 < \rho(K - u)$

Since $\rho(K - u)$ is an integer we have:

$$\rho(u) + m - n - \deg(u) = \rho(K - u)$$

A greedy algorithm computing the rank on K_n .

A greedy algorithm to compute the rank on K_n

Lemma. u effective if and only if parking(u) is positive.

- 1: $u \leftarrow parking(u)$
- 2: rank $\leftarrow -1$
- 3: while $s \ge 0$ do
- 4: substract 1 to a $u_i = 0$ and i < n
- 5: $u \leftarrow parking(u)$
- 6: $rank \leftarrow rank + 1$
- 7: end while
- 8: Return *rank*

$$\rho(u) = \min_{\substack{f \ge 0 \text{ and } u-f \text{ non-effective}}} deg(f) - 1$$

Lemma. For a positive configuration u where $u_i = 0$, there exists in

{ $f \mid u - f$ non-effective, $f \ge 0$ and $degree(f) = \rho(u) + 1$ } a configuration g such that $g_i > 0$. Proof.

$$\begin{array}{c} -(f - a\epsilon^{(j)}) \\ \{v_i = 0 = v_j\} \\ v \\ -a\epsilon^{(j)} \\ \{ \text{ non-effective } \} u - f \end{array} \xrightarrow{(ij).} (ij).v \\ (ij). \\ ($$

$$\rho(u) = \min_{\substack{f \geq 0 \text{ and } u-f \text{ non-effective}}} deg(f) - 1$$

Lemma. For a positive configuration u where $u_i = 0$, there exists in

{ $f \mid u - f$ non-effective, $f \ge 0$ and $degree(f) = \rho(u) + 1$ } a configuration g such that $g_i > 0$. Proof.

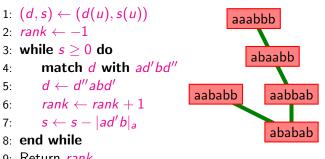

$$\begin{array}{cccc} & & & u & & \\ & -(f - a\epsilon^{(j)}) & & & \\ & \{v_i = 0 = v_j\} & v & & (ij). \\ & & & -a\epsilon^{(j)} & & \\ & & & -a\epsilon^{(i)} & \{=(ij).[-a\epsilon^{(j)}]\} \end{array}$$

Let $\epsilon^{(i)}$ the configuration where $\epsilon^{(i)}_i = 1$ and $\epsilon^{(i)}_j = 0$ for $j \neq i$. Let $f \geq 0$ be an optimal configuration so u - f non-effective. Assume $f_i = 0$, let $j \neq i$ such that $u_j - f_j = -\frac{1}{2} < 0$.

Algorithm in terms of Dyck words

A non-increasing parking configuration $u = (u_1, \ldots, u_{n-1}, s)$ is decomposed into

 $(d(u): \text{ Dyck word of (semi-)length } n-1, s:\mathbb{Z}).$

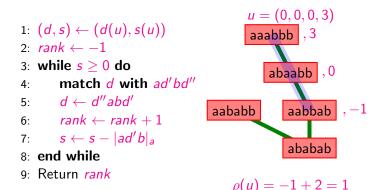

9: Return rank

The *prerank* of a Dyck word d is the number of loop iterations leading to the fixpoint belonging to $(ab)^*$.
