# Ordinary differential equations

Let  $E \subset \mathbb{R}$  compact. Let  $y : [a, b] \rightarrow E$  be the unique solution of:

$$\begin{cases} y' = f(y(t)) \\ y(a) = y_0 \end{cases}$$

- Obtain  $y$ : if  $f$  is continuous, Peano's theorem, limit of sequence of continuous functions
- Compute  $y$ : if  $f$  is continuous, Ten thousand monkeys [CG09]

## Question 1:

Relaxing continuity for  $f$ , when can we obtain  $y$  from  $f$  ?

## Question 2:

What is the set theoretical complexity of  $y$  relative to  $f$ ?

# Antiderivative

- Let  $F : [a, b] \subseteq \mathbb{R} \rightarrow \mathbb{R}$  be a function differentiable on  $[a, b]$
- Let  $f : [a, b] \subseteq \mathbb{R} \rightarrow \mathbb{R}$  be such that  $F'(x) = f(x)$  for all  $x \in [a, b]$

## Question 1:

When can we obtain  $F$  from  $f$ ?

## Question 2:

What is the set theoretical complexity of  $F$  relative to  $f$ ?

- Question 1 investigates methods related to given conditions on  $f$
- Question 2 investigates the complexity of such methods for set descriptive theory

## Conditions on the derivative

If  $f$  satisfies (A) then by (B) we get:

$$F(b) = F(a) + \int_a^b f(x)$$

- (A)  $f$  continuous  
(B) **Fundamental theorem of calculus**  
 $F \in C^1([a, b])$
- (A)  $f$  bounded, continuous almost everywhere ( $\mu_L(D_f) = 0$ )  
(B) **Lebesgue-Vitali theorem**  
 $F \in C^1([a, b])$  almost everywhere
- (A)  $f$  Lebesgue integrable  
(B) **Lebesgue differentiation theorem**  
 $F \in AC$ , Absolutely continuous

# Absolutely continuous AC and bounded variation BV

- If  $F : [a, b] \rightarrow \mathbb{R} \in AC$  then  $F \in BV$

## Definition 1 (BV)

Let  $F : [a, b] \rightarrow \mathbb{R}$ , define the quantity  $V(F) = \sup_{P \in \mathcal{P}} \sum_k |F(x_{k+1}) - F(x_k)|$ .

Then,  $F$  is of *bounded variation* if  $V(F) < +\infty$

- $F \notin BV$  on  $[a, b] \Rightarrow F(b) \neq F(a) + \int_a^b f(x)$
- Bounded variation for  $F \iff$  bounded length for  $y$

## Non-integrable derivative

### Goal:

Investigate complex, non-integrable derivative

### We need to have:

- Baire category theorem  $\Rightarrow f$  continuous on a dense subset of  $[a, b]$
- Darboux theorem  $\Rightarrow f$  has the Darboux property on  $[a, b]$

### Theorem 2 (Darboux)

Let  $F : [a, b] \rightarrow \mathbb{R}$  be differentiable, and let  $f$  be its derivative. Then, for every  $f(a) < c < f(b)$  there is a point  $x \in (a, b)$  such that  $c = f(x)$ .

### Dirichlet's function

$$f(x) = \begin{cases} 1 & \text{if } x \in [a, b] \cap \mathbb{Q} \\ 0 & \text{otherwise} \end{cases}$$

## Darboux functions

- Darboux functions corresponds to continuous functions?
- Topologist's sine curve,  $f(0) = 0$ ,  $f(x) = \sin(\frac{1}{x})$
- Conway base 13, strongly Darboux, nowhere continuous

### Question:

Can  $F \notin BV$  while being an antiderivative?

### Function $\Omega$

$$F(x) \equiv \Omega(x) = \begin{cases} x^2 \sin(\frac{1}{x^2}) & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

$$f(x) \equiv \Omega'(x) = \begin{cases} 2x \sin(\frac{1}{x^2}) - \frac{2}{x} \cos(\frac{1}{x^2}) & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

# Graphics

Figure: Function  $\Omega$

Figure: Function  $\Omega'$

## More complex derivatives: two problematic discontinuities

- Function discontinuous in two points

$$F(x) \equiv \Omega_2(x) = \begin{cases} x^2(1-x)^2 \sin\left(\frac{1}{x^2(1-x)^2}\right) & \text{if } 0 < x < 1 \\ 0 & \text{if } x = 0, 1 \end{cases}$$

## More complex: uncountable problematic discontinuities

- Extension Cantor middle third:

### Cantor set of discontinuities

Define  $\Omega_{2,n}$  as the scaled  $\Omega_{2,n}(x) = 4^{-n}\Omega_2(x)$

Define  $I_{m,n}$ : the  $m$ th (of  $2^n$ ) removed intervals from the  $n$ th step

Define  $f_{m,n}(x) = \Omega_2(x)$  for  $x \in I_{m,n}$ ;  $f_{m,n}(x) = 0$  otherwise

Define  $F(x) = \sum_{n=0}^{\infty} \sum_{m=1}^{2^n} f_{m,n}(x)$

- Since all  $f_{m,n}$  are differentiable,  $F$  converges and  $F'$  converges uniformly,  $F$  is differentiable
- Using fat Cantor set,  $D_f$  with full measure

## Extension of Lebesgue integral

### Question:

Is there a way to compute such antiderivatives?

- Need for another formalization of integration
- Denjoy, 1912, [Den12], iterative process, transfinite induction
- Luzin, 1915, variation absolute continuity
- Perron, 1914, [Per14], equivalent to Denjoy
- Kurzveil, 1957, [Kur57], gauge integral, similar to Riemann
- Henstock, 1957, [Hen57], equivalent to Kurzveil

## Denjoy totalization

- Condition on  $f : [a, b] \rightarrow \mathbb{R}$ :  $f$  is Lebesgue measurable
- Lebesgue measurable  $\not\Rightarrow$  Lebesgue integrable; ex:  $f(x) = \frac{1}{x}$  if  $x \neq 0$ ,  $f(0) = 0$

### Definition 3 (Nonsummable points of $f$ )

Let  $E$  be a closed set  $E \subseteq [a, b]$  and  $f$  a Lebesgue measurable function. A point  $x \in E$  is a *point of nonsummability of  $f$  on  $E$*  if  $f$  is not Lebesgue integrable in every  $I \in E$ ,  $I$  an open interval containing  $x$ .

### Definition 4 (Divergence points of $F$ )

Let  $F$  be a continuous function on  $[a, b]$ , let  $E \subseteq [a, b]$  be closed, and let  $\{(a_i, b_i)\}$  be the contiguous intervals of  $E$  in  $[a, b]$ . A point  $x \in E$  is a *point of divergence of  $F$  on  $E$*  if  $\sum_I |F(b_i) - F(a_i)| = \infty$  for all open intervals  $I$  containing  $x$ , where  $\sum_I$  indicates that we include only the  $(a_i, b_i)$  contained in  $I$ .

## Theorem 5

If  $F$  is a differentiable function on  $[a, b]$  and  $E \subseteq [a, b]$  is closed, then the nonsummable points of  $f$  on  $E$  and the divergence points of  $F$  on  $E$  form a closed nowhere dense set in  $E$ .

## Definition 6 (Nowhere dense)

A subset  $A$  of a topological space  $X$  is nowhere dense in  $X$  if the closure of  $A$  has empty interior.

- Bad behaved points are few for derivatives
- Outside of them we can simply integrate

## Theorem 7

Let  $E \subseteq [a, b]$  be closed and  $\{(a_i, b_i)\}$  the intervals contiguous to  $E$  in  $[a, b]$ . Let  $F$  be differentiable on  $[a, b]$  and assume  $f = F'$  is Lebesgue integrable on  $E$  and  $\sum_i |F(b_i) - F(a_i)| < \infty$ . Then:

$$F(b) - F(a) = \int_E f(x) dx + \sum_i [F(b_i) - F(a_i)].$$

## Iterative process

### Intuition:

We can iteratively compute  $F(d) - F(c)$  for all  $c, d \in [a, b]$ ,  $c < d$

- Let  $E_1 = \{x \in [a, b] \text{ such that } x \text{ is a nonsummable point of } f \text{ on } [a, b]\}$ , and let  $\{(a_i^1, b_i^1)\}$  be its contiguous intervals
- Obtain  $F(d) - F(c)$  for all  $c, d \in [a, b]$  such that  $[c, d] \cap E_1 = \emptyset$
- Since  $F$  is continuous, take limits to obtain  $F(b_i^1) - F(a_i^1)$  for all  $i$ .

### Iterative step

Let  $E_2 = \{x \in [a, b] \text{ such that } x \text{ is a nonsummable point of } f \text{ on } E_1 \text{ or } x \text{ is a divergence point of } F \text{ on } E_1\}$ , and let  $\{(a_i^2, b_i^2)\}$  be its contiguous intervals

- Repeat the above for  $E_2$
- Proceed by transfinite induction, taking intersections at limit ordinals

## Theorem 8 ([Hob21])

Let  $P_n$  be a sequence of closed subsets of  $\mathbb{R}$ . If  $P_{m+1} \subseteq P_m$  for all indexes  $m$  of the sequence, then, either  $P_\alpha$  vanishes for some countable ordinal  $\alpha$ , or else there is a countable ordinal  $\alpha$ , from and after which all the sets are identical.

- If  $P_{m+1} \subseteq P_m$  with  $P_m$  nowhere dense in  $P_{m+1}$ ,  $\Rightarrow P_\alpha = \emptyset$
- The iterative process converges,  $E_\alpha = \emptyset \Rightarrow F(d) - F(c)$  for all  $c, d \in [a, b]$ ,  $c < d$ ; Totalization
- Denjoy and Lebesgue, application of Cantor's transfinite set theory to analysis.
- Denjoy, arbitrary number of countable steps

Question: Luzin

Totality of countable ordinals for antiderivatives?

## Theorem 9 ([DK91])

*The operation of antidifferentiation is not Borel.*

## Theorem 10 ([DK91])

*Let  $x \in \mathbb{R}$ . Let  $f$  be the derivative of  $F$ , with  $f$  recursive. Then the following are equivalent:*

- $x$  is hyperarithmetic,
- $x = F(b) - F(a)$

## Definition 11

A set  $A \subset \mathbb{N}$  is hyperarithmetic if it is definable by a formula of second-order arithmetic with only existential set quantifiers or with only universal set quantifiers. A number  $x \in \mathbb{R}$  is hyperarithmetic if the set  $\{q \in \mathbb{Q} \text{ such that } q < x\}$  is hyperarithmetic.

## Back to ordinary differential equations

Let  $E \subset \mathbb{R}$  compact. Let  $y : [a, b] \rightarrow E$  be the unique solution of:

$$\begin{cases} y' = f(y(t)) \\ y(0) = y_0 \end{cases}$$

### Question 1:

When can we obtain  $y$  from  $f$  with a totalization?

### Question 2:

Can we have hyperarithmetic solutions?

- $f$  is continuous  $\Rightarrow y$ : Peano's theorem, Ten thousand monkeys [CG09]

Lebesgue integration  $\longrightarrow$  Ten Thousand Monkeys

Nonsummability points in  $[a, b] \longrightarrow$  Discontinuity points for  $f$  on  $E$

- Let  $E_1 = \{x \text{ such that } x \text{ is a discontinuity point of } f \text{ on } E\}$ , and let  $\{(a_i^1, b_i^1)\}$  be its contiguous intervals
- Obtain  $y(d) - y(c)$  for all  $c, d \in [a, b]$  such that  $[c, d] \cap E_1 = \emptyset$
- Since  $y$  is continuous, take limits to obtain  $y(b_i^1) - y(a_i^1)$  for all  $i$ .

### Intuition:

We can iteratively compute  $y(d) - y(c)$  for all  $c, d \in [a, b]$ ,  $c < d$

### Main difference with integration:

We are not given the derivative,  $f \circ y$ , but  $f$ .

Nonsummability of  $f \circ y$  in  $[a, b] \not\Rightarrow$  discontinuity of  $f$  on  $E$ .

# Challenges

## Problem 1: Induced topology

- $E_2 = \{x \text{ such that } x \text{ is a discontinuity point of } f|_{E_1} \text{ on } E_1\}$
- Continuity and derivatives are in subspace topology of  $E_1$

## Problem 2: Convergence of iterations

Which conditions on  $f$  such that:

- We need  $E_m$  closed  $\forall m$
- We need  $E_{m+1} \subset E_m, \forall m$

## Problem 3: How can $f$ be given?

- Depending on solution of problem 2 above
- Identifying set descriptive complexity for  $f$
