

Lecture II: Primality

2015/09/21

The slides are available on <http://www.lix.polytechnique.fr/Labo/Francois.Morain/MPRI/2015>

I. Compositeness tests.

II. Primality tests.

I. Compositeness tests

Goal: **prove** that a number is composite.

A) Fermat.

B) Euler-Solovay/Strassen.

C) Miller-Rabin.

D) Other tests.

A) Fermat

Idea: if $\gcd(a, N) = 1$, then $a^{N-1} \equiv 1 \pmod{N}$.

But: $2^{340} \equiv 1 \pmod{341}$: **pseudoprime** to base 2 (psp-2).

Thm. There exists an infinite number of psp-2 numbers.

Thm. (Pomerance) For $x \geq x_0$: $x^{2/7} \ll P_2(x) \ll xL(x)^{-1/2}$ with $L(x) = \exp\{\log x \log \log \log x / \log \log x\}$.

Def. $P(N) = \#\{a \in (\mathbb{Z}/N\mathbb{Z})^*, a^{N-1} \equiv 1 \pmod{N}\}$.

Thm. If $N = \prod_i p_i^{\alpha_i}$, $P(N) = \prod_i \gcd(p_i - 1, N - 1)$.

Proof: ■

The test

function isComposite(N)

1. Choose a at random in $\mathbb{Z}/N\mathbb{Z} - \{0\}$.
2. Compute $g = \gcd(a, N)$; **if** $g > 1$, **then** return (**yes**, $g \mid N$).
3. **if** $a^{N-1} \not\equiv 1 \pmod{N}$, **then** return (**yes**, a)
otherwise return **I don't know**.

Cost. $O((\log N)M(\log N))$; typically $O((\log N)^3)$, asymptotically $\tilde{O}((\log N)^2)$.

Prop. Proba("I don't know") = $P(N)/(N - 1)$.

Proof. Probability of yes is:

$$\left(1 - \frac{\varphi(N)}{N - 1}\right) + \frac{\varphi(N)}{N - 1} \left(1 - \frac{P(N)}{\varphi(N)}\right). \square$$

Rem. if N is prime, proba is 1...!

Carmichael numbers

Def. composite N s.t. $P(N) = \varphi(N)$.

Ex. 561.

Rem. $P(N)/(N - 1) = \varphi(N)/(N - 1)$ close to 1.

Thm.(Alford, Granville, Pomerance, 1992) There are infinitely many Carmichael numbers.

More properties of Carmichael numbers:

1. N is squarefree.
2. For all $p \mid N$, $p - 1 \mid N - 1$ (equivalently $\lambda(N) \mid N - 1$).
3. N has at least three prime factors.

B) Euler and Solovay-Strassen

Idea: (Euler) if N is prime and $\gcd(a, N) = 1$, then $a^{(N-1)/2} \equiv \left(\frac{a}{N}\right) \pmod{N}$.

Pb: $2^{(1105-1)/2} \equiv \left(\frac{2}{1105}\right) \pmod{1105}$; this is an Euler pseudoprime to base 2 (epsp-2). There are an infinite number of them.

Prop. $E_2(x) \leq P_2(x)$.

Def. $\mathcal{E}(N) = \{a \in (\mathbb{Z}/N\mathbb{Z})^*, a^{(N-1)/2} \equiv \left(\frac{a}{N}\right) \pmod{N}\}; E(N) = \#\mathcal{E}(N)$.

Prop. $\mathcal{E}(N)$ is proper subgroup of $(\mathbb{Z}/N\mathbb{Z})^*$.

Coro. $E(N)/\varphi(N) \leq 1/2$.

The test

function isComposite2(N)

1. Choose a at random in $\mathbb{Z}/N\mathbb{Z} - \{0\}$.
2. Compute $g = \gcd(a, N)$; **if** $g > 1$, **then** return (**yes**, $g \mid N$).
3. **If** $a^{(N-1)/2} \not\equiv \left(\frac{a}{N}\right) \pmod{N}$ **then** return (**yes**, a)
else return **I don't know**.

Prop. $\text{Proba}(\text{"I don't know"}) = E(N)/(N - 1) \leq 1/2$.

Coro. $\text{isComposite?} \in \text{RP}$ (hence **isPrime?** $\in \text{co-RP}$).

Miller (1975): $a = 2, 3, \dots$; Ankeny–Montgomery–Lenstra–Bach: if an adequate Riemann hypothesis is true, then the smallest witness is $< 2(\log N)^2$, yielding a deterministic $O((\log N)^3 M(\log N))$ algorithm.

C) Miller-Rabin

N being odd, write $N - 1 = 2^s t$ with $s \geq 1$ and odd t .

$$a^{N-1} - 1 = (a^t - 1)(a^t + 1)(a^{2t} + 1) \cdots (a^{2^{s-1}t} + 1)$$

$$(MR_a) : a^t \equiv 1 \pmod{N} \text{ or } \exists j, 0 \leq j < s, a^{2^j t} \equiv -1 \pmod{N}.$$

Pb: $N = 2047 = 23 \times 89$ is s.t. $N - 1 = 2 \times 1023$ and $2^{(N-1)/2} \equiv 1 \pmod{N}$: strong-pseudoprime to base 2 (spsp-2).

Thm. spsp- $a \Rightarrow$ epsp- a .

Def. $F(N) = \#\{a \in (\mathbb{Z}/N\mathbb{Z})^*, (MR_a) \text{ is satisfied}\}$.

Thm. [Corollary of Monier's] $F(N)/(N - 1) \leq 1/4$.

The test

function isComposite3(N)

1. Choose a at random in $\mathbb{Z}/N\mathbb{Z} - \{0\}$.
2. Compute $g = \gcd(a, N)$; **if** $g > 1$, **then** return (*yes, $g \mid N$*).
3. **If** (MR_a) **then** return (*yes, a*)
else return *I don't know*.

Prop. Proba("I don't know") = $F(N)/(N - 1)$.

Numerical tables

x	$P_2(x)$	$E_2(x)$	$F_2(x)$	$C(x)$	$\pi(x)$

Building primes?

function randomProbablePrime(b)

repeat

 choose odd N at random in $[2^{b-1}, 2^b]$

until N passes k tests.

$p_{b,k} = \text{Proba}(X = N \text{ is composite} | Y_k = N \text{ passes } k \text{ tests}) = ?$

Rem. What we know is

$\text{Proba}(Y_k = N \text{ passes } k \text{ tests} | X = N \text{ is composite}) \leq (1/4)^k$.

Thm. (Burthe, 1996) $\forall b \geq 2, \forall k \geq 1, p_{b,k} \leq 4^{-k}$.

Other tests

Goal: reduce the non-answer probability while keeping the computations fast.

- Algebraic extensions: Lucas (degree 2), Adams & Shanks, Gurak.
- Elliptic curves: Gordon.
- Combinations of the preceding: no examples known of spsp-a and Lucas pseudoprime, for instance.
- Frobenius pseudoprimes à la Grantham: $\leq 1/7710$. Cf. also Zhang.

II. Primality tests

Goal: **prove** that a number is prime.

A) Fermat

B) En route for P.

C) Agrawal, Kayal, Saxena.

A) Fermat

Thm. N is prime if and only if $(\mathbb{Z}/N\mathbb{Z})^*$ is cyclic of ordre $N - 1$:

$$\left. \begin{array}{l} a^{N-1} \equiv 1 \pmod{N} \\ \forall p \mid N-1, a^{\frac{N-1}{p}} \not\equiv 1 \pmod{N} \end{array} \right\} \Rightarrow N \text{ is prime}$$

Certificate: $(N, \{p \mid N-1\}, a) \Rightarrow \text{isPrime?} \in \text{NP}$.

Thm. (Pocklington, 1914) Let s s.t. $s \mid N - 1$

$$\left. \begin{array}{l} a^{N-1} \equiv 1 \pmod{N} \\ \forall q \text{ prime } \mid s, \gcd(a^{\frac{N-1}{q}} - 1, N) = 1 \end{array} \right\} \Rightarrow \forall p \mid N, p \equiv 1 \pmod{s}$$

Coro. $s > \sqrt{N} \Rightarrow N$ is prime.

Rem. factorisation is not polynomial time in the classical world (see later), but polynomial quantic; search for a is not either (except if Riemann is true or randomized approach).

Example of use

Hyp. We know how to find all prime factors < 20 .

$$\begin{aligned} N_0 &= 100003, \quad N_0 - 1 = 2 \times 3 \times 7 \times N_1, \\ N_1 &= 2381, \quad N_1 - 1 = 2^2 \times 5 \times 7 \times 17 \end{aligned}$$

p	2	5	7	17
$3^{(N_1-1)/p} \bmod N_1$	2380	1347	1944	949

$\Rightarrow N_1$ is prime

$$s = N_1 > \sqrt{N_0}$$

$$2^{N_0-1} \equiv 1 \pmod{N_0}, \gcd(2^{(N_0-1)/N_1} - 1, N_0) = 1$$

$\Rightarrow N_0$ is prime

Rem. We have got a **(recursive) primality proof** of depth $O(\log N)$.

The $N + 1$ test

For a_0 and a_1 integers, let:

$$A_N = A_N(a_0, a_1) = \mathbb{Z}/N\mathbb{Z}[T]/(T^2 + a_1 T + a_0)$$

and $\Delta = a_1^2 - 4a_0$.

Elements of A_N are $u + v\alpha$ with u, v dans $\mathbb{Z}/N\mathbb{Z}$, computations made using $\alpha^2 = -a_1\alpha - a_0$.

Thm. Let p be a prime $\nmid \Delta$.

- if $(\Delta/p) = -1$, then $A_p \sim \mathbb{F}_{p^2}$;
- if $(\Delta/p) = +1$, then $A_p \sim \mathbb{Z}/p\mathbb{Z} \times \mathbb{Z}/p\mathbb{Z}$.

Proof : If $(\Delta/p) = -1$, $T^2 + a_1 T + a_0$ is irreducible, hence we recover the classical construction of \mathbb{F}_{p^2} .

If $(\Delta/p) = +1$, $T^2 + a_1 T + a_0 = (T - u)(T - v)$ with $u \not\equiv v \pmod{p}$.

Therefore

$$A_p \sim (\mathbb{Z}/p\mathbb{Z})[T]/(T - u) \times (\mathbb{Z}/p\mathbb{Z})[T]/(T - v) \sim \mathbb{Z}/p\mathbb{Z} \times \mathbb{Z}/p\mathbb{Z}. \square$$

Fundamental theorem

Thm. Let N be an odd integer. Assume that we found a_0, a_1 s.t. $\Delta = a_1^2 - 4a_0$ satisfies $(\Delta/N) = -1$. Write $N + 1 = \prod_i q_i^{\beta_i}$. Suppose we have found $\theta \in A_N = A_N(a_0, a_1)$ s.t.

$$\theta^{N+1} = 1 \text{ in } A_N,$$

and for all i :

$$\theta^{(N+1)/q_i} = u_i + v_i\alpha \text{ with } (u_i - 1, v_i, N) = 1.$$

Then N is prime.

Proof: assume N is composite and let $p \mid N$ with $p \leq \sqrt{N}$.

Reduce $A_N \bmod p$ towards A_p :

$$\tau = \theta \bmod p = (u \bmod p) + (v \bmod p)\alpha.$$

We get

$$\tau^{N+1} = 1 \text{ in } A_p, \quad \tau^{(N+1)/q_i} \neq 1 \text{ in } A_p$$

which proves τ has ordre $N + 1$ in $(A_p)^*$.

Hence $N + 1 \leq \#A_p = p^2$, contradiction. \square

Remarks

- Pocklington-like theorems exist.
- Deduce from this the degree 2 pseudoprimes.
- All this can be reformulated in terms of Lucas sequences (bouhhhh!).
- **Lucas-Lehmer:** $M_m = 2^m - 1$ is prime iff for $L_0 = 4$, $L_{n+1} = L_n^2 - 2 \bmod M_m$, one has $L_{m-2} = 0$ [using $\sqrt{3}$].

\Rightarrow largest known primes, e.g., $M_{43112609}$ with 12,978,189 decimal digits.

Lower bound (?) for primality proving algorithms:
 $O((\log N)M(M_p))$ (super fast arithmetic!).

B) En route for P

- Gauss and Jacobi sums: L. Adleman, C. Pomerance, S. Rumely (1980, 1983); H. Cohen, H. W. Lenstra, Jr (1981 – 1984) ; H. Cohen, A. K. Lenstra (1982, 1987). W. Bosma & M.-P. van der Hulst (1990) ; P. Mihăilescu (1998). deterministic $O((\log N)^{c_1 \log \log \log N})$.
- almost **RP**: Goldwasser and Kilian using elliptic curves (1986); practical algorithm by Atkin (1986; later FM). See Smith's part.
- **RP**: Adleman and Huang using hyperelliptic curves (1986ff). See Smith's part.

C) Agrawal, Kayal, Saxena (AKS)

First idea: (Agrawal, Biswas – 1999)

Prop. N is prime iff $P(X) = (X + 1)^N - X^N - 1 \equiv 0 \bmod N$.

In practice: choose $Q(X) \in \mathbb{Z}/N\mathbb{Z}[X]$ at random of degree $O(\log N)$. If

$$(X + 1)^N \not\equiv X^N + 1 \bmod (Q(X), N)$$

then N is composite.

The probability of failure is bounded by $1 - 1/(4 \log N)$.

Conjecture: If N is composite, there exists $1 \leq r \leq \log N$ s.t. $P(X)$ is not divisible by $X^r - 1$ modulo N .

Thm. Let N, s be integers, r a prime number and $q = P(r - 1)$. If:

(0)

$$\binom{q-1+s}{s} > N^{2\lfloor \sqrt{r} \rfloor};$$

- (i) $N \neq M^k$, $k > 1$;
- (ii) N has no prime factor $\leq s$;
- (iii) $N^{(r-1)/q} \bmod r \notin \{0, 1\}$;
- (iv) $\forall a, 1 \leq a \leq s, (X-a)^N \equiv X^N - a \bmod (X^r - 1, N)$;

then N is prime.

For a proof, see FM's Bourbaki article.

What next?

- cf. D. Bernstein homepage for more on the history of improvements to the basic test; including: [H. W. Lenstra, Jr.](#) ($\tilde{O}_{\text{eff}}((\log N)^{12})$ or $\tilde{O}((\log N)^8)$), [S. David](#).
- Cleaner version of AKS: $\tilde{O}_{\text{eff}}((\log N)^{10.5})$ or $\tilde{O}((\log N)^{7.5})$.
- [H. W. Lenstra, C. Pomerance](#) : $\tilde{O}_{\text{eff}}((\log N)^6)$.
- [P. Berrizbeitia / Q. Cheng](#) :
Let r prime s.t. $r^\alpha \mid N - 1$, $r \geq \log^2 N$; $1 < a < N$ s.t.
 $a^{r^\alpha} \equiv 1 \bmod N$, $\gcd(a^{r^{\alpha-1}} - 1, N) = 1$,
 $(X+1)^N = X^N + 1 \bmod (X^r - a, N)$, then N is prime. Heuristic complexity would be $\tilde{O}((\log N)^4)$ for these numbers.
- [D. Bernstein, P. Mihăilescu](#): use $e \mid N^d - 1$; inject cyclotomic ideas, $\tilde{O}((\log N)^4)$.

V. Conclusions for primality

Which algorithm?

- **easy to understand / implement, fast**: compositeness tests;
- **fast, proven**: Jacobi;
- **fast, heuristic**: ECPP;
- **certificate**: ECPP;
- **deterministic polynomial**: AKS.

D. Bernstein has an AKS example for $2^{1024} + 643$ (13 hours on 800 MHz PC, 200 Mb memory).

To be compared to FASTECPP:

14/07/03: FM, **7000dd** with mpifastECPP.

19/08/03: J. Franke, T. Kleinjung, T. Wirth, **10000dd**.

15/10/10: FM, **25,050 dd** with mpifastECPP (2000 CPU days).

Rem. 2013: Franke et al., **30,008 dd** with combination CIDE.

What's left to be done?

Open questions:

- Is $\tilde{O}((\log N)^4)$ the best running time for all numbers?
Compare: $\tilde{O}((\log N)^2)$ for Fermat or Mersenne numbers.
- **Claim** (Lukes, Patterson, Williams): $\tilde{O}((\log N)^3)$ under GRH?
(pseudosquares or pseudocubes).
- Combination of tests?
