## Minimal free-energy folding prediction

- Nussinov-style RNA folding
- Turner energy model
- MFold/Unafold

# Foreword ...

... or how to make a million bucks by giving change parsimoniously!!

**Problem:** You have access to unlimited amount of **1**, **20** and **50** cents coins.  
A client prefers to travel light, i.e. to **minimize the #coins**.  
How to give **N** cents back in change without losing a customer?

**Strategy #1:** Start with *heaviest* coins, and then complete/fill-up with coins of *decreasing* value.

$$21 = ??$$

$$55$$

$$60$$

# Foreword ...

... or how to make a million bucks by giving change parsimoniously!!

**Problem:** You have access to unlimited amount of **1**, **20** and **50** cents coins.  
A client prefers to travel light, i.e. to **minimize the #coins**.  
How to give **N** cents back in change without losing a customer?

**Strategy #1:** Start with *heaviest* coins, and then complete/fill-up with coins of *decreasing* value.

$$21 = \text{£}20 + \text{£}1$$

$$55 = \text{£}50 + \text{£}2 + \text{£}2 + \text{£}2 + \text{£}1 + \text{£}1$$

$$60 = \text{£}50 + \text{£}2 + \text{£}2 + \text{£}1 ??$$

## Foreword ...

... or how to make a million bucks by giving change parsimoniously!!

**Problem:** You have access to unlimited amount of **1**, **20** and **50** cents coins.  
A client prefers to travel light, i.e. to **minimize the #coins**.  
How to give **N** cents back in change without losing a customer?

**Strategy #1:** Start with *heaviest* coins, and then complete/fill-up with coins of *decreasing* value.

$$21 = \text{£}20 + \text{1 cent}$$

$$55 = \text{£}50 + \text{£}20 + \text{£}20 + \text{£}20 + \text{1 cent}$$

$$60 = \text{£}50 + \text{£}20 + \text{£}20 + \text{£}20 + \text{1 cent} ??$$

$$= \text{£}20 + \text{£}20 + \text{£}20 !$$

Problem *a priori* (?) non-solvable using such a *greedy* approach, as a (simpler) problem is already NP-complete (thus Efficient solution  $\Rightarrow$  1M\$).

**Strategy #2:** Brute force enumeration  $\rightarrow \#Coins^N$  (Ouch!)

**Strategy #3:** The following recurrence gives the minimal number of coins:

$$\text{Min}\#\text{Coins}(N) = \text{Min} \left\{ \begin{array}{lcl} \text{£1 coin} & \rightarrow & 1 + \text{Min}\#\text{Coins}(N - 1) \\ \text{£20 coin} & \rightarrow & 1 + \text{Min}\#\text{Coins}(N - 20) \\ \text{£50 coin} & \rightarrow & 1 + \text{Min}\#\text{Coins}(N - 50) \end{array} \right.$$

With some memory ( $N$  intermediate computations), the minimum number of coins can be obtained after  $N \times \#Coins$  operations. An optimal set of coins can be obtained by **tracing back** the choices performed at each stage, leading to the minimum.

**Remark:** We still haven't won the million, as  $N$  has **exponential value compared to the length of its encoding**, so the algorithm does not qualify as *efficient* (i.e. polynomial).

Still, this approach is much more efficient than a brute-force enumeration:  
 $\Rightarrow$  Dynamic programming.

**Strategy #2:** Brute force enumeration  $\rightarrow \#Coins^N$  (Ouch!)

**Strategy #3:** The following recurrence gives the minimal number of coins:

$$\text{Min}\#\text{Coins}(\textcolor{red}{N}) = \text{Min} \left\{ \begin{array}{lcl} \text{£1} & \rightarrow & 1 + \text{Min}\#\text{Coins}(\textcolor{red}{N} - 1) \\ \text{£20} & \rightarrow & 1 + \text{Min}\#\text{Coins}(\textcolor{red}{N} - 20) \\ \text{£50} & \rightarrow & 1 + \text{Min}\#\text{Coins}(\textcolor{red}{N} - 50) \end{array} \right.$$

With some memory ( $\textcolor{red}{N}$  intermediate computations), the minimum number of coins can be obtained after  $\textcolor{red}{N} \times \#Coins$  operations. An optimal set of coins can be obtained by **tracing back** the choices performed at each stage, leading to the minimum.

**Remark:** We still haven't won the million, as  $\textcolor{red}{N}$  has **exponential value compared to the length of its encoding**, so the algorithm does not qualify as *efficient* (i.e. polynomial).

Still, this approach is much more efficient than a brute-force enumeration:  
 $\Rightarrow$  Dynamic programming.

# Dynamic programming: General principle

**Dynamic programming =** General optimization technique.

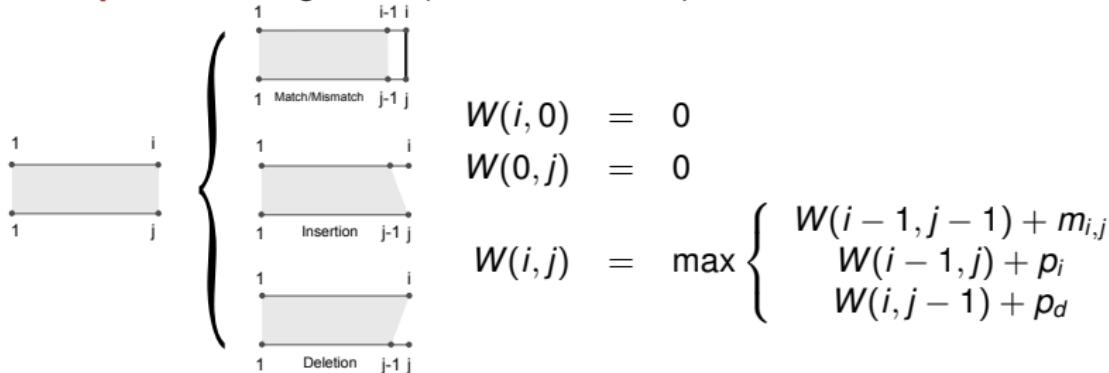

**Prerequisite:** Optimal solution for problem  $P$  can be derived from solutions to strict sub-problems of  $P$ .

## Bioinformatics :

Discrete solution space (alignments, structures...)

- + Additively-inherited objective function (cost, log-odd score, energy...)
- ⇒ Efficient dynamic programming scheme

## Example: Local Alignment (Smith/Waterman)

## Algorithmic details

**Dynamic programming scheme** defines a space of (sub)problems and a recurrence that relates the score of a problem to that of smaller problems.

Given a scheme, two steps :

- ▶ **Matrix filling:** Computation and tabulation of best scores (Computed from smaller problems to larger ones).
- ▶ **Traceback:** Reconstruct best solution from contributing subproblems.

Complexity of algorithm depends on:

- ▶ **Cardinality** of sub-problem space
- ▶ **Number of alternatives** considered at each step (#Terms in recurrence)

### Smith&Waterman example:

- ▶  $i: 1 \rightarrow n + 1 \Rightarrow \Theta(n)$
  - ▶  $j: 1 \rightarrow m + 1 \Rightarrow \Theta(m)$
  - ▶ 3 operations at each step
- $\Rightarrow \Theta(m.n)$  time/memory

$$W(i, 0) = 0$$

$$W(0, j) = 0$$

$$W(i, j) = \max \begin{cases} W(i - 1, j - 1) + m_{i,j} \\ W(i - 1, j) + p_i \\ W(i, j - 1) + p_d \end{cases}$$

# Complete example

**Example:** Local alignment of AGCACACA and ACACACTA

**Costs:** Match  $m_{i,j} = +2$ , Insertion/Déletion  $p_i = p_j = -1$

$$W(i, 0) = 0$$

$$W(0, j) = 0$$

$$W(i, j) = \max \begin{cases} W(i - 1, j - 1) + m_{i,j} \\ W(i - 1, j) + p_i \\ W(i, j - 1) + p_d \end{cases}$$

## 1 Introduction

- Dynamic programming 101
- Dynamic programming: Reminder

## 2 Minimal free-energy folding prediction

- Nussinov-style RNA folding
- Turner energy model
- MFold/Unafold

## Nussinov/Jacobson energy model (NJ)

Base-pair maximization (with a twist):

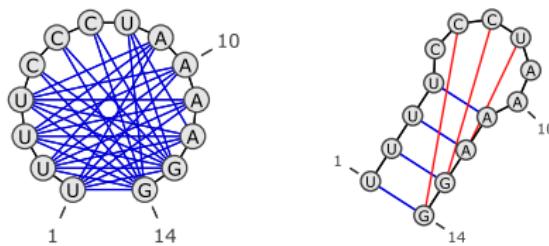

- ▶ Additive model on independently contributing base-pairs;
- ▶ Canonical base-pairs only: Watson/Crick (A/U,C/G) and Wobble (G/U)

$$\Rightarrow E_{\omega,S} = -\# \text{Paires}(S)$$

Folding in NJ model  $\Leftrightarrow$  Base-pair (weight) maximization

Example:

UUUUUCCCUAAAAGG

Variant: Weight each pair with  $-\#\text{Hydrogen bonds}$

$$\Delta G(G \equiv C) = -3$$

$$\Delta G(A = U) = -2$$

$$\Delta G(G - U) = -1$$

## Nussinov/Jacobson energy model (NJ)

**Base-pair maximization (with a twist):**

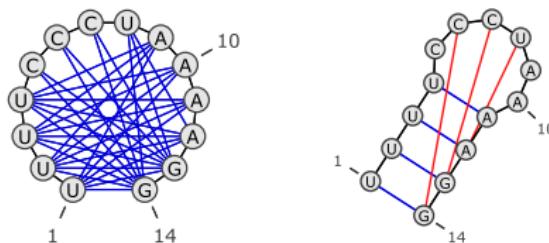

- ▶ Additive model on independently contributing base-pairs;
- ▶ Canonical base-pairs only: Watson/Crick (A/U,C/G) and Wobble (G/U)

$$\Rightarrow E_{\omega,S} = -\# \text{Paires}(S)$$

Folding in NJ model  $\Leftrightarrow$  Base-pair (**weight**) maximization

**Example:**

UUUUUCCCUAAAAGG

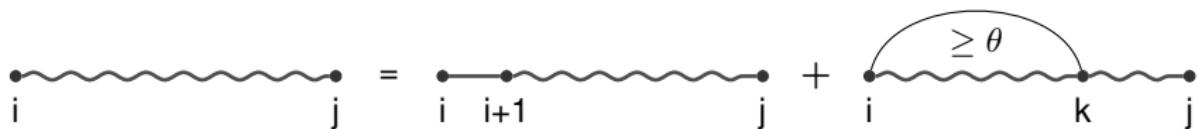

**Variant:** Weight each pair with  $-\#\text{Hydrogen bonds}$

$$\Delta G(G \equiv C) = -3$$

$$\Delta G(A = U) = -2$$

$$\Delta G(G - U) = -1$$

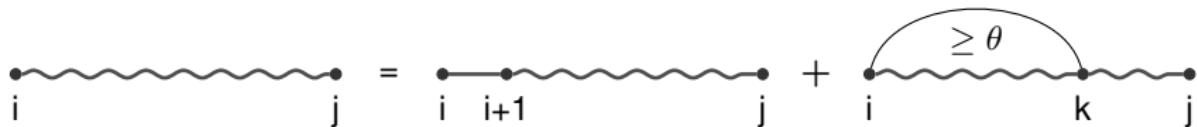

# Nussinov/Jacobson DP scheme

$$N_{i,t} = 0, \quad \forall t \in [i, i + \theta]$$

$$N_{i,j} = \min \left\{ \begin{array}{ll} N_{i+1,j} & i \text{ unpaired} \\ \min_{k=i+\theta+1}^j \Delta G_{i,k} + N_{i+1,k-1} + N_{k+1,j} & i \text{ paired with } k \end{array} \right.$$

# Nussinov/Jacobson DP scheme

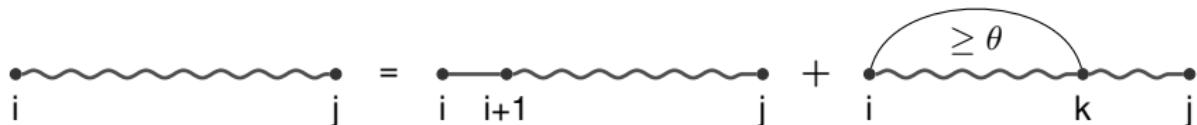

$$N_{i,t} = 0, \quad \forall t \in [i, i + \theta]$$

$$N_{i,j} = \min \left\{ \begin{array}{ll} N_{i+1,j} & i \text{ unpaired} \\ \min_{k=i+\theta+1}^j \Delta G_{i,k} + N_{i+1,k-1} + N_{k+1,j} & i \text{ paired with } k \end{array} \right.$$

**Correctness.** Goal = Show that MFE over interval  $[i, j]$  is indeed found in  $N_{i,j}$  after completing the computation. Proceed by induction:

- ▶ Assume that property holds for any  $[i', j']$  such that  $j' - i' < n$ .
- ▶ Consider  $[i, j], j - i = n$ . Let  $\text{MFE}_{i,j} :=$  Base-pairs of best struct. on  $[i, j]$ . Then first position  $i$  in  $\text{MFE}_{i,j}$  is either:
  - ▶ **Unpaired:**  $\text{MFE}_{i,j} = \text{MFE}_{i+1,j}$   $\rightarrow$  free-energy =  $N_{i+1,j}$
  - ▶ **Paired to  $k$ :**  $\text{MFE}_{i,j} = \{(i, k)\} \cup \text{MFE}_{i+1,k-1} \cup \text{MFE}_{k+1,j}$ .  
(Indeed, any BP between  $[i+1, k-1]$  and  $[k+1, j]$  would cross  $(i, k)$ )  
 $\rightarrow$  free-energy =  $\Delta G_{i,k} + N_{i+1,k-1} + N_{k+1,j}$

# Nussinov/Jacobson DP scheme

  - ▶ **Paired to  $k$ :**  $MFE_{i,j} = \{(i, k)\} \cup MFE_{i+1,k-1} \cup MFE_{k+1,j}$ .  
(Indeed, any BP between  $[i+1, k-1]$  and  $[k+1, j]$  would cross  $(i, k)$ )  
 $\rightarrow$  free-energy =  $\Delta G_{i,k} + N_{i+1,k-1} + N_{k+1,j}$

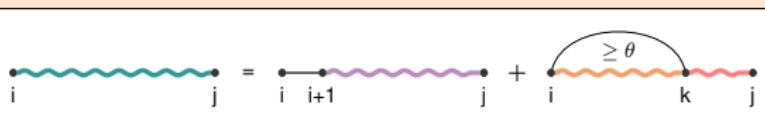

⇒  $N_{i,j}$  indeed contains MFE over  $[i, j]$ .

# Turner energy model

Based on **unambiguous** decomposition of 2<sup>ary</sup> structure into **loops**:

- ▶ Internal loops
- ▶ Bulges
- ▶ Terminal loops
- ▶ Multi loops
- ▶ Stackings

Free-energy  $\Delta G$  of a loop depend on bases, assymmetry, dangles ...

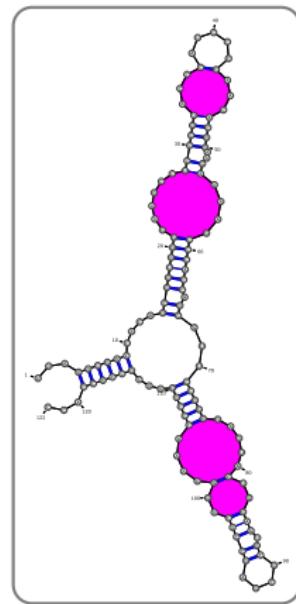

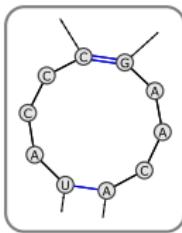

Experimentally determined  
+ Interpolated for larger loops.

Improved results by taking stacking into account.

# MFE DP equations

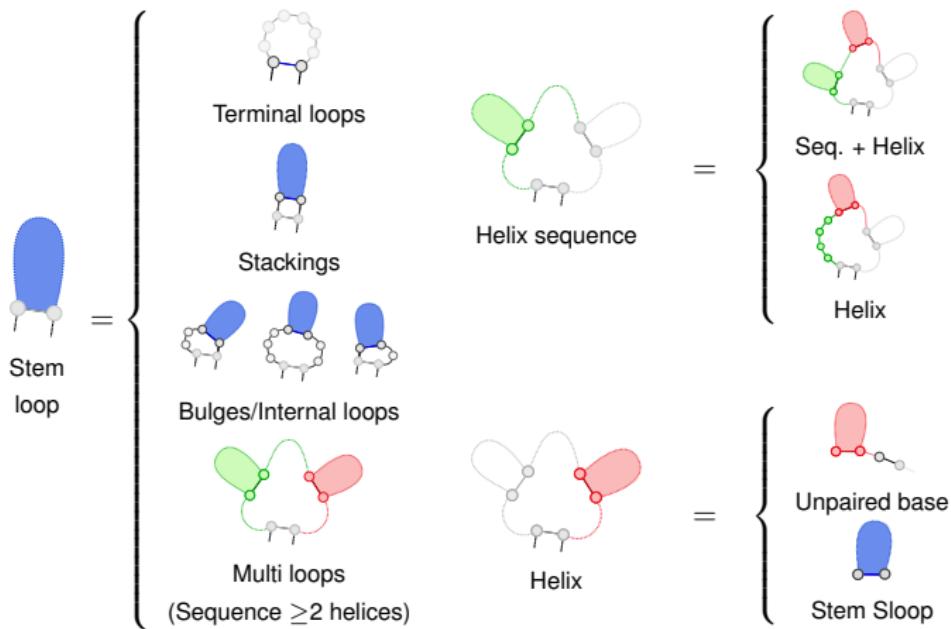

# MFE DP equations

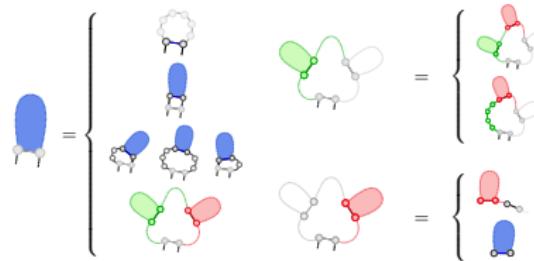

# MFE DP equations

# MFE DP equations

- ▶  $E_H(i, j)$ : Energy of terminal loop enclosed by  $(i, j)$  pair
- ▶  $E_{BI}(i, j)$ : Energy of bulge or internal loop enclosed by  $(i, j)$  pair
- ▶  $E_S(i, j)$ : Energy of stacking  $(i, j)/(i+1, j-1)$
- ▶ Penalty for multi loop (a), and occurrences of unpaired base (b) and helix (c) in multi loops.

## DP recurrence

$$\begin{aligned}
 \mathcal{M}'_{i,j} &= \min \left\{ \begin{array}{l} E_H(i, j) \\ E_S(i, j) + \mathcal{M}'_{i+1, j-1} \\ \text{Min}_{i', j'} (E_{BI}(i, i', j', j) + \mathcal{M}'_{i', j'}) \\ a + c + \text{Min}_k (\mathcal{M}_{i+1, k-1} + \mathcal{M}^1_{k, j-1}) \end{array} \right\} \\
 \mathcal{M}_{i,j} &= \text{Min}_k \left\{ \min (\mathcal{M}_{i, k-1}, b(k-1)) + \mathcal{M}^1_{k, j} \right\} \\
 \mathcal{M}^1_{i,j} &= \text{Min}_k \left\{ b + \mathcal{M}^1_{i, j-1}, c + \mathcal{M}'_{i, j} \right\}
 \end{aligned}$$

# Backtracking

Backtracking to reconstruct most stable structure from MFE:

$$\begin{aligned}\mathcal{M}'_{i,j} &= \text{Min} \left\{ \begin{array}{c} E_H(i,j) \\ E_S(i,j) + \mathcal{M}'_{i+1,j-1} \\ \text{Min}_{i',j'}(E_{BI}(i,i',j',j) + \mathcal{M}'_{i',j'}) \\ a + c + \text{Min}_k(\mathcal{M}_{i+1,k-1} + \mathcal{M}^1_{k,j-1}) \end{array} \right\} \\ \mathcal{M}_{i,j} &= \text{Min}_k \left\{ \min(\mathcal{M}_{i,k-1}, b(k-1)) + \mathcal{M}^1_{k,j} \right\} \\ \mathcal{M}^1_{i,j} &= \text{Min}_k \left\{ b + \mathcal{M}^1_{i,j-1}, c + \mathcal{M}'_{i,j} \right\}\end{aligned}$$

## Complexity:

For each min,  $\mathcal{O}(n)$  potential contributors

⇒ **Worst-case** complexity in  $\mathcal{O}(n^2)$  for **naive backtrack**.

Keep best contributor for each Min ⇒ **Backtracking in  $\mathcal{O}(n)$**

⇒ UnaFold [MZ08]/RNAFold [HFS<sup>+</sup>94] compute the MFE for the Turner model in **overall**<sup>1</sup> time/space complexities in  $\mathcal{O}(n^3)/\mathcal{O}(n^2)$

---

<sup>1</sup>Using a trick/restriction for internal loops...

# Backtracking

$$\begin{aligned}\mathcal{M}'_{i,j} &= \text{Min} \left\{ \begin{array}{l} E_H(i,j) \\ E_S(i,j) + \mathcal{M}'_{i+1,j-1} \\ \text{Min}_{i',j'}(E_{BI}(i,i',j',j) + \mathcal{M}'_{i',j'}) \\ a + c + \text{Min}_k(\mathcal{M}_{i+1,k-1} + \mathcal{M}^1_{k,j-1}) \end{array} \right\} \\ \mathcal{M}_{i,j} &= \text{Min}_k \left\{ \min(\mathcal{M}_{i,k-1}, b(k-1)) + \mathcal{M}^1_{k,j} \right\} \\ \mathcal{M}^1_{i,j} &= \text{Min}_k \left\{ b + \mathcal{M}^1_{i,j-1}, c + \mathcal{M}'_{i,j} \right\}\end{aligned}$$

## Complexity:

For each min,  $\mathcal{O}(n)$  potential contributors

⇒ Worst-case complexity in  $\mathcal{O}(n^2)$  for naive backtrack.

Keep best contributor for each Min ⇒ Backtracking in  $\mathcal{O}(n)$

⇒ UnaFold [MZ08] / RNAFold [HFS<sup>+</sup>94] compute the MFE for the Turner model in overall<sup>1</sup> time/space complexities in  $\mathcal{O}(n^3)/\mathcal{O}(n^2)$

<sup>1</sup>Using a trick/restriction for internal loops...

# Backtracking

Backtracking to reconstruct most stable structure from MFE:

$$\begin{aligned}\mathcal{M}'_{i,j} &= \text{Min} \left\{ \begin{array}{c} E_H(i,j) \\ E_S(i,j) + \mathcal{M}'_{i+1,j-1} \\ \text{Min}_{i',j'}(E_{BI}(i,i',j',j) + \mathcal{M}'_{i',j'}) \\ a + c + \text{Min}_k(\mathcal{M}_{i+1,k-1} + \mathcal{M}^1_{k,j-1}) \end{array} \right\} \\ \mathcal{M}_{i,j} &= \text{Min}_k \left\{ \min(\mathcal{M}_{i,k-1}, b(k-1)) + \mathcal{M}^1_{k,j} \right\} \\ \mathcal{M}^1_{i,j} &= \text{Min}_k \left\{ b + \mathcal{M}^1_{i,j-1}, c + \mathcal{M}'_{i,j} \right\}\end{aligned}$$

## Complexity:

For each min,  $\mathcal{O}(n)$  potential contributors

$\Rightarrow$  **Worst-case complexity in  $\mathcal{O}(n^2)$  for naive backtrack.**

Keep best contributor for each Min  $\Rightarrow$  Backtracking in  $\mathcal{O}(n)$

$\Rightarrow$  UnaFold [MZ08]/RNAFold [HFS<sup>+</sup>94] compute the MFE for the Turner model in **overall<sup>1</sup>** time/space complexities in  $\mathcal{O}(n^3)/\mathcal{O}(n^2)$

<sup>1</sup>Using a trick/restriction for internal loops...
