A – Kinetic Landscape

Continuous-time Markov chain

Given **free-energy** $E : \{A, C, G, U\}^* \times \mathcal{S} \rightarrow \mathbb{R}$, at the Boltzmann equilibrium:

$$\mathbb{P}(\mathcal{S} \mid w) \propto e^{-E(w, \mathcal{S})/RT}$$

- ▶ **Minimum Free-Energy (MFE)**: Relevant structure = Most stable/probable
- ▶ **Partition function**: Equilibrium properties of Boltzmann ensemble
- ▶ **Kinetics**: Finite-time evolution of concentrations/probabilities

B – Evolution of concentrations

Turner energy model

Based on **unambiguous** decomposition of 2^{ary} structure into **loops**:

- ▶ Internal loops
- ▶ Bulges
- ▶ Terminal loops
- ▶ Multi loops
- ▶ Stackings

Free-energy ΔG of a loop depend on bases, assymetry, dangles ...

Experimentally determined
+ Interpolated for larger loops.

Improved results by taking stacking into account.

Outline

Turner energy model
MFold/Unafold

Boltzmann ensemble

Nussinov: Minimisation \Rightarrow Counting

Computing the partition function

Statistical sampling

Performances and the comparative approach

Towards a 3D ab-initio prediction

The canonical Boltzmann Ensemble

RNA *breathes* \Rightarrow There is no more than a single conformation.

New paradigm

The conformations of an RNA **coexist** in the **Boltzmann distribution**.

Consequence: The MFE probability can be arbitrarily small.

\Rightarrow To understand how RNA acts, one must account for the set of alternative structures.

In particular, structurally close structures may *ally*, and become the most realistic candidate in the search for a functional conformation.

The canonical Boltzmann Ensemble

RNA *breathes* \Rightarrow There is no more than a single conformation.

New paradigm

The conformations of an RNA **coexist** in the **Boltzmann distribution**.

Consequence: The MFE probability can be arbitrarily small.

\Rightarrow To understand how RNA acts, one must account for the set of alternative structures.

In particular, structurally close structures may *ally*, and become the most realistic candidate in the search for a functional conformation.

Boltzmann Distribution: Definition

For each structure S compatible with an RNA ω , the Boltzmann distribution associates a **Boltzmann factor** $\beta_{S,\omega} = e^{\frac{-E_{S,\omega}}{RT}}$, where:

- ▶ $E_{S,\omega}$ is the free-energy S (kCal.mol^{-1})
- ▶ T is the temperature (K)
- ▶ R is the perfect gaz constant ($1.986.10^{-3} \text{ kCal.K}^{-1}.\text{mol}^{-1}$)

To obtain a distribution, one simply renormalizes by the **partition function**

$$\mathcal{Z}_\omega = \sum_{S \in \mathcal{S}_\omega} e^{\frac{-E_{S,\omega}}{RT}}$$

where \mathcal{S}_ω is the set of conformations that are compatibles with ω .

The **Boltzmann probability** of a structure S is simply given by

$$P_{S,\omega} = \frac{e^{\frac{-E_{S,\omega}}{RT}}}{\mathcal{Z}_\omega}.$$

Nussinov/Jacobson DP scheme

$$N_{i,t} = 0, \quad \forall t \in [i, i + \theta]$$

$$N_{i,j} = \min \begin{cases} N_{i+1,j} & i \text{ unpaired} \\ \min_{k=i+\theta+1}^j \Delta G_{i,k} + N_{i+1,k-1} + N_{k+1,j} & i \text{ paired with } k \end{cases}$$

Ambiguity? Consider i : Either **unpaired**, or **paired** to k .

Sets of structures generated in these two cases are clearly disjoint.

(also holds for various values of k) \Rightarrow **Unambiguous** decomposition

Completeness? True, since scheme explores every possible outcome for i .

+ Induction on interval length \Rightarrow **Complete** decomposition

Nussinov/Jacobson DP scheme

Recurrence for **minimal free-energy** of a fold :

$$N_{i,t} = 0, \quad \forall t \in [i, i + \theta]$$

$$N_{i,j} = \min \begin{cases} N_{i+1,j} & (i \text{ unpaired}) \\ \min_{k=i+\theta+1}^j E_{i,k} + N_{i+1,k-1} + N_{k+1,j} & (i \text{ comp. with } k) \end{cases}$$

Recurrence for **counting compatible structures** :

$$C_{i,t} = 1, \quad \forall t \in [i, i + \theta]$$

$$C_{i,j} = \sum \begin{cases} C_{i+1,j} & (i \text{ unpaired}) \\ \sum_{k=i+\theta+1}^j 1 \times C_{i+1,k-1} \times C_{k+1,j} & (i \text{ comp. with } k) \end{cases}$$

Decomposition matters, and the rest (MFE, count. . .) follows!

Partition function

Partition function = **Weighted count** over compatible structures

$$Z_{i,t} = 1, \quad \forall t \in [i, i + \theta]$$

$$Z_{i,j} = \sum \left\{ \begin{array}{l} Z_{i+1,j} \\ \sum_{k=i+\theta+1}^j 1 \times Z_{i+1,k-1} \times Z_{k+1,j} \end{array} \right.$$

Partition function

Partition function = **Weighted count** over compatible structures

$$z_{i,t} = 1, \quad \forall t \in [i, i + \theta]$$
$$z_{i,j} = \sum \left\{ \begin{array}{l} z_{i+1,j} \\ \sum_{k=i+\theta+1}^j e^{\frac{-E_{bp}(i,k)}{RT}} \times z_{i+1,k-1} \times z_{k+1,j} \end{array} \right.$$

Partition function

Partition function = **Weighted count** over compatible structures

$$\mathcal{M}'_{i,j} = \text{Min} \begin{cases} E_H(i,j) \\ E_S(i,j) + \mathcal{M}'_{i+1,j-1} \\ \text{Min}(E_{BI}(i,i',j',j) + \mathcal{M}'_{i',j'}) \\ a + c + \text{Min}(\mathcal{M}_{i+1,k-1} + \mathcal{M}^1_{k,j-1}) \end{cases}$$

$$\mathcal{M}_{i,j} = \text{Min} \left\{ \text{Min}(\mathcal{M}_{i,k-1}, b(k-1)) + \mathcal{M}^1_{k,j} \right\}$$

$$\mathcal{M}^1_{i,j} = \text{Min} \left\{ b + \mathcal{M}^1_{i,j-1}, c + \mathcal{M}'_{i,j} \right\}$$

Partition function

Partition function = **Weighted count** over compatible structures

$$\mathcal{M}'_{i,j} = \text{Min} \left\{ \begin{array}{l} e^{\frac{-E_H(i,j)}{RT}} \\ e^{\frac{-E_G(i,j)}{RT}} + \mathcal{M}'_{i+1,j-1} \\ \text{Min} \left(e^{\frac{-E_B(i,i',j',j)}{RT}} + \mathcal{M}'_{i',j'} \right) \\ e^{\frac{-(a+c)}{RT}} + \text{Min} (\mathcal{M}_{i+1,k-1} + \mathcal{M}^1_{k,j-1}) \end{array} \right.$$

$$\mathcal{M}_{i,j} = \text{Min} \left\{ \text{Min} \left(\mathcal{M}_{i,k-1}, e^{\frac{-b(k-1)}{RT}} \right) + \mathcal{M}^1_{k,j} \right\}$$

$$\mathcal{M}^1_{i,j} = \text{Min} \left\{ e^{\frac{-b}{RT}} + \mathcal{M}^1_{i,j-1}, e^{\frac{-c}{RT}} + \mathcal{M}'_{i,j} \right\}$$

Partition function

Partition function = **Weighted count** over compatible structures

$$\begin{aligned}
 \mathcal{M}'_{i,j} &= \text{Min} \left\{ \begin{array}{l} e^{\frac{-E_H(i,j)}{RT}} \\ e^{\frac{-E_G(i,j)}{RT}} \mathcal{M}'_{i+1,j-1} \\ \text{Min} \left(e^{\frac{-E_B(i,i',j',j)}{RT}} \mathcal{M}'_{i',j'} \right) \\ e^{\frac{-(a+c)}{RT}} \text{Min} (\mathcal{M}_{i+1,k-1} \mathcal{M}'_{k,j-1}) \end{array} \right. \\
 \mathcal{M}_{i,j} &= \text{Min} \left\{ \text{Min} \left(\mathcal{M}_{i,k-1}, e^{\frac{-b(k-1)}{RT}} \right) \mathcal{M}'_{k,j} \right\} \\
 \mathcal{M}'_{i,j} &= \text{Min} \left\{ e^{\frac{-b}{RT}} \mathcal{M}'_{i,j-1}, e^{\frac{-c}{RT}} \mathcal{M}'_{i,j} \right\}
 \end{aligned}$$

Partition function

Partition function = **Weighted count** over compatible structures

$$\begin{aligned}
 \mathcal{Z}'(i, j) &= \sum \left\{ \begin{aligned} &e^{\frac{-E_H(i, j)}{RT}} \\ &e^{\frac{-E_S(i, j)}{RT}} \mathcal{Z}'(i+1, j-1) \\ &+ \sum \left(e^{\frac{-E_{BH}(i, i', j', j)}{RT}} \mathcal{Z}'(i', j') \right) \\ &+ e^{\frac{-(a+c)}{RT}} \sum \left(\mathcal{Z}(i+1, k-1) \mathcal{Z}'(k, j-1) \right) \end{aligned} \right. \\
 \mathcal{Z}(i, j) &= \sum \left(\mathcal{Z}(i, k-1) + e^{\frac{-b(k-1)}{RT}} \right) \mathcal{Z}'(k, j) \\
 \mathcal{Z}'(i, j) &= e^{\frac{-b}{RT}} \mathcal{Z}'(i, j-1) + e^{\frac{-c}{RT}} \mathcal{Z}'(i, j)
 \end{aligned}$$

Partition function

Partition function = **Weighted count** over compatible structures

$$\begin{aligned} Z_{i,t} &= 1, \quad \forall t \in [i, i + \theta] \\ Z_{i,j} &= \sum \left\{ \begin{array}{l} Z_{i+1,j} \\ \sum_{k=i+\theta+1}^j e^{-\frac{E_{bp}(i,k)}{RT}} \times Z_{i+1,k-1} \times Z_{k+1,j} \end{array} \right. \end{aligned}$$

Validity of a partition function computation:

- ▶ **Completeness/Unambiguity** of decomposition scheme
- ▶ Correctness of Boltzmann factor

Weight induced by backtrack = Product of derivations weights

$e^{-E/RT} \rightarrow$ Weight products \Leftrightarrow Summing energy terms

$$\begin{aligned} e^{-E_{bp}(i,k)/RT} \times Z_{i+1,k-1} \times Z_{k+1,j} &= \cdot \sum_x e^{-E(x)/RT} \cdot \sum_y e^{-E(y)/RT} \\ &= \sum_{x,y} e^{-a/RT} \cdot e^{-E(x)/RT} \cdot e^{-E(y)/RT} \\ &= \sum_{x,y} e^{-(E_{bp}(i,k)+E(x)+E(y))/RT} \end{aligned}$$

Partition function

Partition function = **Weighted count** over compatible structures

$$\begin{aligned} Z_{i,t} &= 1, \quad \forall t \in [i, i + \theta] \\ Z_{i,j} &= \sum \left\{ \begin{array}{l} Z_{i+1,j} \\ \sum_{k=i+\theta+1}^j e^{-\frac{E_{bp}(i,k)}{RT}} \times Z_{i+1,k-1} \times Z_{k+1,j} \end{array} \right. \end{aligned}$$

Validity of a partition function computation:

- ▶ Completeness/Unambiguity of decomposition scheme
- ▶ Correctness of Boltzmann factor

Weight induced by backtrack = Product of derivations weights

$e^{-E/RT} \rightarrow$ Weight products \Leftrightarrow Summing energy terms

$$\begin{aligned} e^{-E_{bp}(i,k)/RT} \times Z_{i+1,k-1} \times Z_{k+1,j} &= \cdot \sum_x e^{-E(x)/RT} \cdot \sum_y e^{-E(y)/RT} \\ &= \sum_{x,y} e^{-a/RT} \cdot e^{-E(x)/RT} \cdot e^{-E(y)/RT} \\ &= \sum_{x,y} e^{-(E_{bp}(i,k)+E(x)+E(y))/RT} \end{aligned}$$

Statistical sampling of RNA 2^{ary} structures

MFE (\Leftrightarrow Max probability) may be **heavily dominated** by a set \mathcal{B} of **structurally similar** suboptimal structures.

\Rightarrow Functional conformation probably closer to \mathcal{B} than to MFE.

Proof-of-concept: [DCL05]

- ▶ Sample structures within Boltzmann probability
- ▶ Cluster structures
- ▶ Build and return consensus structure of the heaviest cluster

\Rightarrow Relative improvement for specificity (+17.6%) and sensitivity (+21.74%, except group II introns)

Problem

How to sample from the Boltzmann ensemble?

Stochastic backtrack (adapted from SFo1d)

Goal [DL03]: From sequence ω , draw S with prob. $e^{-E_S/RT} / \mathcal{Z}$

Principle: Choose derivation with prob. prop. to its contribution to part. fun.

Precomputation: Compute part. fun. versions of matrices (\mathcal{Z} , \mathcal{Z}' , \mathcal{Z}^1).

Stochastic backtrack:

1. Draw uniform random number $r \in [0, \mathcal{Z}'(i, j))$
2. Subtract from r the contributions of $\mathcal{Z}'(i, j)$ until $r < 0$
3. Recurse over associated regions/matrices

$$\mathcal{Z}'(i, j) \equiv \left\{ \begin{array}{l} \rightarrow e^{-\frac{E_H(i, j)}{RT}} + e^{-\frac{E_S(i, j)}{RT}} \mathcal{Z}'(i+1, j-1) \\ \rightarrow \sum \left(e^{-\frac{E_{BJ}(i, i', j', j)}{RT}} \mathcal{Z}'(i', j') \right) \\ \rightarrow e^{-\frac{(a+c)}{RT}} \sum (\mathcal{Z}(i+1, k-1) \mathcal{Z}^1(k, j-1)) \end{array} \right. \begin{array}{l} \text{A} \\ \text{B} \\ \text{C} \end{array}$$

2. Subtract from r the contributions of $\mathcal{Z}'(i, j)$ until $r < 0$
3. Recurse over associated regions/matrices

$$\mathcal{Z}'(i, j) = \sum \left\{ \begin{array}{l} e^{-\frac{E_H(i, j)}{RT}} + e^{-\frac{E_S(i, j)}{RT}} \mathcal{Z}'(i+1, j-1) \quad \text{A} \\ \sum \left(e^{-\frac{E_{B_l}(i, i', j', j)}{RT}} \mathcal{Z}'(i', j') \right) \quad \text{B} \\ e^{-\frac{(a+c)}{RT}} \sum (\mathcal{Z}(i+1, k-1) \mathcal{Z}^1(k, j-1)) \quad \text{C} \end{array} \right.$$

The diagram shows a sequence of matrices: $A_1, A_2, B_i, B_{i+1}, \dots, B_{j-1}, B_j, C_i, C_{i+1}, \dots, C_{j-1}, C_j$. The matrices A_1, A_2 are blue, B_i, B_{i+1} are pink, B_{j-1}, B_j are red, and $C_i, C_{i+1}, \dots, C_{j-1}, C_j$ are green. A box labeled r is positioned above C_i , with a downward arrow pointing to it.

Stochastic backtrack (adapted from SFo1d)

Goal [DL03]: From sequence ω , draw S with prob. $e^{-E_S/RT} / \mathcal{Z}$

Principle: Choose derivation with prob. prop. to its contribution to part. fun.

Precomputation: Compute part. fun. versions of matrices (\mathcal{Z} , \mathcal{Z}' , \mathcal{Z}^1).

Stochastic backtrack:

1. Draw uniform random number $r \in [0, \mathcal{Z}'(i, j))$
2. Subtract from r the contributions of $\mathcal{Z}'(i, j)$ until $r < 0$
3. Recurse over associated regions/matrices

$$\mathcal{Z}'(i, j) = \sum \left\{ \begin{array}{l} e^{-\frac{E_H(i, j)}{RT}} + e^{-\frac{E_S(i, j)}{RT}} \mathcal{Z}'(i+1, j-1) \quad \text{A} \\ \sum \left(e^{-\frac{E_{B_l}(i, i', j', j)}{RT}} \mathcal{Z}'(i', j') \right) \quad \text{B} \\ e^{-\frac{E_C(i, j)}{RT}} \sum (\mathcal{Z}(i+1, k-1) \mathcal{Z}^1(k, j-1)) \quad \text{C} \end{array} \right.$$

Therefore the probability of generated S is

$$p_S = \frac{\mathcal{B}(\{S\})}{\mathcal{B}(\mathcal{S}_\omega)} = \frac{e^{-E_S/RT}}{\mathcal{Z}} = P_{S, \omega}$$

Complexity

Goal [DL03]: From sequence ω , draw S with prob. $e^{-E_S/RT} / \mathcal{Z}$

Stochastic backtrack:

1. Draw uniform random number $r \in [0, \mathcal{Z}'(i, j))$
2. Subtract from r the contributions of $\mathcal{Z}'(i, j)$ until $r < 0$
3. Recurse over associated regions/matrices

Average-case complexity in $\Theta(k \times n\sqrt{n})$ (homopolymer model) [Pon08].

Boustrophedon search $\Rightarrow \mathcal{O}(k \times n \log n)$ worst-case [Pon08].

Complexity

Goal [DL03]: From sequence ω , draw S with prob. $e^{-E_S/RT} / \mathcal{Z}$

Stochastic backtrack:

1. Draw uniform random number $r \in [0, \mathcal{Z}'(i, j))$
2. Subtract from r the contributions of $\mathcal{Z}'(i, j)$ until $r < 0$
3. Recurse over associated regions/matrices

$$\mathcal{Z}'(i, j) = \sum \left\{ \begin{array}{l} e^{-\frac{E_H(i, j)}{RT}} + e^{-\frac{E_S(i, j)}{RT}} \mathcal{Z}'(i+1, j-1) \quad \text{A} \\ \sum \left(e^{-\frac{E_{B_l}(i, i', j', j)}{RT}} \mathcal{Z}'(i', j') \right) \quad \text{B} \\ e^{-\frac{(a+c)}{RT}} \sum (\mathcal{Z}(i+1, k-1) \mathcal{Z}^1(k, j-1)) \quad \text{C} \end{array} \right.$$

After $\Theta(n)$ operations, recurse over region of length $n - 1$
 \Rightarrow Worst-case complexity in $\mathcal{O}(k \times n^2)$ for k samples

Average-case complexity in $\Theta(k \times n\sqrt{n})$ (homopolymer model) [Pon08].

Boustrophedon search $\Rightarrow \mathcal{O}(k \times n \log n)$ worst-case [Pon08].

Two main approaches

Definition (Ab initio folding)

Starting from sequence, find conformation that minimizes free-energy.

Advantages:

- ▶ Mechanical nature allows the (in)validation of models
- ▶ Reasonable complexity
 $\mathcal{O}(n^3)/\mathcal{O}(n^2)$ time/space
- ▶ *Exhaustive* nature

Limitations:

- ▶ Hard to include PKs
- ▶ Highly dependent on energy model
- ▶ No cooperativity
- ▶ Limited performances

Definition (Comparative approach)

Starting from homologous sequences, postulate common structure and find best possible tradeoff between folding & alignment.

Avantages :

- ▶ Better performances
- ▶ (Limited) cooperativity
- ▶ Self-improving

Limitations

- ▶ Easily unreasonable complexity
- ▶ Non exhaustive search
- ▶ Captures *transient* structures
